DigiDr Generic FAQ Bank: 6 Sets per Speciality

22 specialities, 6 sets each, 6 FAQs per set (792 FAQs). Doctor neutral. Assign one set per doctor, or reshuffle FAQs across sets.

1. General Medicine / Family Physician

Set 1

No.	Question	Answer
1	**What are the common signs of type 2 diabetes?**	Frequent urination, excess thirst, unexplained weight loss, tiredness and slow healing wounds are common signs. Many people have no symptoms early, so a simple blood sugar test is the only way to know.
2	**How is high blood pressure detected and managed?**	It is found with regular blood pressure checks, as it often causes no symptoms. Management combines less salt, regular activity, weight control and medicines when needed.
3	**When should a fever be taken seriously?**	A fever lasting more than 3 days, crossing 103°F, or coming with rash, severe headache, breathlessness or confusion needs prompt medical attention. Dengue, typhoid and malaria are common causes in India.
4	**How can I tell if my tiredness is something more serious?**	Tiredness that lasts weeks, comes with weight change, pallor, breathlessness or low mood needs checking. Common causes include anaemia, thyroid problems, vitamin deficiency and diabetes.
5	**Which health check-ups should adults do every year?**	Blood pressure, blood sugar, cholesterol, thyroid, liver and kidney tests are a good yearly base. Your age and family history decide which extra tests are needed.
6	**How do I prevent seasonal infections like flu and viral fever?**	Wash hands often, stay hydrated, sleep well and take the annual flu vaccine. Stay home and rest when unwell to avoid spreading infection.

Set 2

No.	Question	Answer

No.	Question	Answer
1	**What are the symptoms of an underactive thyroid?**	Tiredness, weight gain, feeling cold, dry skin, constipation and low mood are common signs. A simple TSH blood test confirms it, and daily tablets usually restore normal energy.
2	**How do I know if I am anaemic?**	Pale skin, weakness, breathlessness on climbing stairs and dizziness are typical signs. A haemoglobin test confirms it, and iron rich food or supplements correct most cases.
3	**How is typhoid spread and how can I avoid it?**	Typhoid spreads through contaminated food and water. Drink boiled or filtered water, eat freshly cooked food, wash hands and consider the typhoid vaccine.
4	**Why is vitamin D deficiency so common in India?**	Indoor lifestyles, covered clothing and darker skin reduce vitamin D made from sunlight. A blood test guides supplements, and 15 to 20 minutes of morning sun helps.
5	**What causes acidity and how can I reduce it?**	Spicy meals, late dinners, stress, smoking and being overweight are common triggers. Smaller meals, an early dinner and avoiding triggers bring relief, and persistent symptoms need a check.
6	**Is it safe to take painkillers regularly for headaches?**	Frequent painkillers can cause stomach irritation, kidney strain and rebound headaches. If you need them more than 2 or 3 times a week, find the underlying cause instead.

Set 3

No.	Question	Answer
1	**What are the warning signs of dengue?**	Sudden high fever with severe body pain, pain behind the eyes and a low platelet count are key signs. Persistent vomiting, bleeding gums or severe belly pain need urgent care.
2	**What are the symptoms of a urinary tract infection?**	Burning while passing urine, frequent urges, cloudy urine and lower belly discomfort are common. Drinking plenty of water helps, and a urine test guides the right antibiotic.
3	**What causes jaundice and when is it serious?**	Jaundice turns the skin and eyes yellow because of liver or bile problems, often from hepatitis A or E. Dark urine, vomiting or lasting yellowness needs a liver test.
4	**Can prediabetes be reversed?**	Yes, in many people. Losing 5% to 7% of body weight, walking 30 minutes a day and cutting sugary foods can bring blood sugar back to normal.
5	**When is a long cough a sign of tuberculosis?**	A cough lasting more than 2 weeks, especially with night sweats, weight loss or blood in sputum, needs a sputum test and chest X-ray. TB is fully curable with a complete course.
6	**What triggers migraine and how can it be managed?**	Stress, skipped meals, poor sleep, bright light and certain foods can trigger it. A regular routine, a headache diary and the right medicines reduce attacks.

Set 4

No.	Question	Answer

No.	Question	Answer
1	**How does malaria present and how is it treated?**	Fever with chills and sweating that comes in cycles is typical. A rapid blood test confirms it, and a full course of antimalarial medicine cures it.
2	**What is fatty liver and can I reverse it?**	Fat builds up in the liver, often due to weight gain, diabetes or alcohol. Weight loss, exercise and cutting sugar and fried food can clear it in many people.
3	**What does BMI tell me about my health?**	BMI relates weight to height and helps flag overweight and underweight. For Indians, a BMI above 23 already raises risk, and waist size gives extra insight.
4	**How much sleep do adults really need?**	Most adults need 7 to 8 hours. Regular poor sleep raises the risk of diabetes, high blood pressure and low mood, so a fixed bedtime routine pays off.
5	**How can I avoid food poisoning?**	Eat freshly cooked food, store leftovers cold and wash fruits and vegetables well. Be careful with street food during monsoon and use clean water for ice.
6	**What are the early signs of kidney disease?**	Foamy urine, swelling of feet or face, tiredness and rising blood pressure can be early signs. Simple urine and creatinine tests catch it before major damage.

Set 5

No.	Question	Answer
1	**Why does chikungunya cause long lasting joint pain?**	The virus inflames the joints, so pain and stiffness can last weeks or months after the fever settles. Rest, gentle movement and doctor advised pain relief help recovery.
2	**How can I recognise asthma in adults?**	Wheezing, a tight chest, night cough and breathlessness with dust or cold air point to asthma. Inhalers control it well and let people live fully active lives.
3	**What are the signs of vitamin B12 deficiency?**	Tingling in hands and feet, tiredness, memory slips and a sore tongue are common signs. Vegetarians are at higher risk, and supplements or injections correct it.
4	**What causes sudden dizziness?**	Low blood pressure, dehydration, anaemia, ear balance problems or low sugar can cause it. Dizziness with chest pain, weakness on one side or speech trouble needs emergency care.
5	**Are antibiotics needed for every cold or fever?**	No. Most colds and fevers are viral, and antibiotics do not help them. Taking them unnecessarily builds resistance that makes future infections harder to treat.
6	**How do I prevent heat stroke in summer?**	Drink water and ORS often, avoid peak afternoon sun and wear light cotton clothes. Confusion, very hot dry skin or fainting means move to shade, cool the body and get urgent help.

Set 6

No.	Question	Answer

No.	Question	Answer
1	**Which illnesses rise during the monsoon?**	Dengue, malaria, typhoid, leptospirosis and stomach infections increase. Avoid wading through dirty water, use mosquito protection and keep food and water clean.
2	**What is uric acid and how does it cause gout?**	High uric acid can form crystals in joints, causing sudden painful swelling, often in the big toe. Less red meat and alcohol, more water and medicines prevent attacks.
3	**What is irritable bowel syndrome?**	It causes belly pain with bloating, loose stools or constipation without any damage to the gut. Fibre, regular meals, stress control and trigger food tracking bring good relief.
4	**What does an HbA1c test show?**	It shows your average blood sugar over the past 3 months. It helps diagnose diabetes and check if your treatment is working, without needing to fast.
5	**When is a sore throat more than a simple infection?**	Most are viral and settle in a few days with warm fluids and rest. Severe pain, high fever, pus on the tonsils or trouble swallowing needs a doctor check.
6	**Is unexplained weight loss a reason to worry?**	Losing more than 5% of body weight in 6 months without trying should be checked. Thyroid problems, diabetes, infections and other conditions can be found with simple tests.

2. Cardiology

Set 1

No.	Question	Answer
1	**What are the early warning signs of a heart attack?**	Chest pressure or pain, pain spreading to the arm, jaw or back, sweating, nausea and breathlessness are key signs. Women may feel only unusual fatigue or discomfort. Seek emergency care immediately.
2	**How does high cholesterol affect the heart?**	Excess LDL cholesterol builds up in artery walls and narrows them, raising the risk of heart attack and stroke. It has no symptoms, so a lipid profile test is essential.
3	**What is the difference between a heart attack and cardiac arrest?**	A heart attack is a blocked blood supply to the heart muscle. Cardiac arrest is when the heart suddenly stops beating effectively. Both are emergencies.
4	**Can high blood pressure be controlled without lifelong medicines?**	Mild cases can improve with lifestyle change such as low salt, exercise and weight loss. Many people still need medicines, and stopping them without advice is risky.
5	**What causes palpitations and when are they a concern?**	Stress, caffeine and anxiety are common triggers and are usually harmless. Palpitations with dizziness, chest pain or fainting may point to an arrhythmia and need an ECG.
6	**Which tests are used to check heart health?**	ECG, echocardiogram, treadmill test, lipid profile and sometimes CT angiography are commonly used. The right test depends on your symptoms and risk factors.

Set 2

No.	Question	Answer
1	**What is angina and how is it different from a heart attack?**	Angina is chest discomfort when the heart muscle gets too little blood, usually during effort, and settles with rest. A heart attack pain lasts longer and does not ease, so treat it as an emergency.
2	**What are the symptoms of heart failure?**	Breathlessness, swollen ankles, quick tiredness and needing extra pillows to sleep are common signs. Medicines and lifestyle changes help many people stay active.
3	**What is atrial fibrillation and why does it matter?**	It is an irregular heartbeat that raises the risk of blood clots and stroke. An ECG detects it, and treatment lowers stroke risk and eases symptoms.
4	**Does family history increase my heart risk?**	Yes, a parent or sibling with early heart disease raises your risk. You can offset much of it with early screening, a healthy diet and regular exercise.
5	**What does a heart healthy Indian diet look like?**	Choose whole grains, dals, vegetables, fruits and nuts, and use less ghee, fried snacks and sugar. Cooking with small amounts of oil and rotating oils protects your arteries.
6	**How do stents and bypass surgery differ?**	A stent opens one or few blocked arteries with a small tube through a thin catheter. Bypass surgery creates new routes around several or complex blockages.

Set 3

No.	Question	Answer
1	**Why are heart attacks increasing in young Indians?**	Smoking, diabetes, high cholesterol, stress, poor sleep and inactivity are major reasons. A genetic tendency to early heart disease also plays a part, so screening from the 30s helps.
2	**How do I recognise a stroke quickly?**	Look for face drooping, arm weakness and speech difficulty, and act fast. Reaching a hospital within hours greatly improves recovery.
3	**How quickly does quitting smoking help the heart?**	Heart attack risk starts falling within weeks and drops sharply in the first year. After 10 to 15 years, the risk comes close to that of a non smoker.
4	**Can stress really damage the heart?**	Long term stress raises blood pressure and encourages habits like smoking and overeating. Exercise, good sleep and relaxation practices protect the heart.
5	**Is it safe to exercise with a heart condition?**	Usually yes, and it is often advised, but the type and intensity should suit your condition. Stop and seek help for chest pain, severe breathlessness or dizziness.
6	**Are statins safe for long term use?**	Statins lower cholesterol and reduce heart attack and stroke risk, and serious side effects are uncommon. Regular check-ups catch any muscle or liver issues early.

Set 4

No.	Question	Answer
1	**What are congenital heart defects?**	These are heart problems present from birth, such as holes in the heart or valve narrowing. Many can be detected early and corrected with procedures or surgery.
2	**How does rheumatic heart disease start?**	It follows untreated strep throat in childhood, which can scar heart valves. Treating sore throats fully in children prevents it.
3	**When is a pacemaker needed?**	It is advised when the heart beats too slowly or has blocks that cause fainting, dizziness or tiredness. The small device keeps a steady rhythm and restores daily activity.
4	**What is cardiac rehabilitation?**	It is a supervised programme of exercise, diet advice and counselling after a heart attack or surgery. It lowers the chance of another event and speeds recovery.
5	**What do high triglycerides mean?**	They are blood fats that rise with sugar, refined carbs, alcohol and excess weight. Cutting sweets and alcohol and exercising often brings them down.
6	**Why do my feet swell and is it a heart problem?**	Swollen feet can come from heart, kidney or liver problems, long standing or certain medicines. Swelling with breathlessness needs a prompt heart check.

Set 5

No.	Question	Answer

No.	Question	Answer
1	**What is a calcium score scan?**	It is a quick CT scan that measures calcium in the heart arteries. A higher score signals more plaque and helps decide how strongly to prevent disease.
2	**What is a Holter test?**	It is a small device worn for 24 to 48 hours that records your heart rhythm continuously. It catches irregular beats that a brief ECG may miss.
3	**How can I tell gas pain from heart pain?**	Gas pain often changes with burping or posture, while heart pain feels like pressure and comes with sweating or breathlessness. When unsure, get an ECG at once.
4	**Why are people with diabetes at higher heart risk?**	High blood sugar slowly damages blood vessels and speeds up plaque build up. Good sugar, pressure and cholesterol control greatly cut this risk.
5	**Can sleep apnoea affect the heart?**	Yes, repeated breathing pauses at night raise blood pressure and strain the heart. Loud snoring with daytime sleepiness should be tested and treated.
6	**Is coconut oil or desi ghee good for the heart?**	Both are high in saturated fat, which can raise LDL cholesterol if used freely. Small amounts are acceptable within a balanced diet.

Set 6

No.	Question	Answer
1	**What should recovery after a heart attack look like?**	Most people return to light activity within weeks with gradual increases. Taking medicines daily, eating well and attending follow ups lowers the chance of another attack.
2	**Is pregnancy safe for women with heart disease?**	Many women with heart conditions have safe pregnancies with planning and close monitoring. Discuss medicines and risks before conceiving.
3	**Why are blood thinners prescribed?**	They prevent clots that can cause stroke or heart attack. Take them exactly as advised and report unusual bleeding.
4	**What causes fainting and when is it dangerous?**	Dehydration, standing up fast or emotional stress are common harmless triggers. Fainting during exercise or with palpitations or chest pain needs a heart evaluation.
5	**Do women face different heart risks?**	Heart disease is a leading cause of death in women, and risk rises after menopause. Symptoms can be subtle, like fatigue or nausea, so do not ignore them.
6	**Can thin people have high cholesterol?**	Yes, genes and diet matter as much as weight. A lipid profile test is the only way to know.

3. Dermatology

Set 1

No.	Question	Answer
1	**What causes acne and how can it be treated?**	Excess oil, clogged pores, bacteria and hormonal changes cause acne. Treatment includes topical retinoids, antibiotics and, in some cases, oral medicines, based on severity.
2	**Is hair fall normal and when should I worry?**	Losing 50 to 100 hairs a day is normal. Sudden thinning, bald patches or a widening parting need evaluation for causes like thyroid issues, deficiencies or hair loss conditions.
3	**What is eczema and is it contagious?**	Eczema is a chronic condition causing dry, itchy, inflamed skin. It is not contagious. Moisturisers, trigger avoidance and prescribed creams keep it under control.
4	**How do I manage fungal infections like ringworm?**	Keep skin dry, avoid sharing towels and complete the full antifungal course. Stopping early is the main reason infections return.
5	**What is psoriasis and can it be controlled?**	Psoriasis is an immune condition causing thick, scaly patches. It cannot be cured but modern treatments can control it well and reduce flare-ups.
6	**How can I protect my skin from sun damage?**	Use a broad spectrum sunscreen of SPF 30 or higher, reapply every 2 to 3 hours and cover up in peak sun. Any mole that changes shape or colour should be checked.

Set 2

No.	Question	Answer
1	**What causes dandruff and how do I get rid of it?**	A yeast on the scalp and oily skin cause flaking and itching. Anti dandruff shampoos with ketoconazole or zinc pyrithione used regularly keep it away.
2	**What is vitiligo and is it contagious?**	Vitiligo causes white patches when pigment cells stop working. It is not contagious, and treatments can stop spread and restore colour in many people.
3	**What triggers hives and itchy welts?**	Foods, medicines, infections, heat and stress can trigger them. Antihistamines settle most cases, while swelling of lips or breathing trouble is an emergency.
4	**How do warts spread and how are they treated?**	Warts spread through a virus by touch or shared surfaces. Freezing, medicated paints or other procedures clear them, and picking them can spread them.
5	**How do I know if I have scabies?**	Intense itching that worsens at night with small rashes between fingers or on the waist points to scabies. Everyone in the household should be treated together.
6	**What causes melasma and how can it be improved?**	Sun exposure and hormones cause brown patches on the cheeks and forehead. Daily sunscreen and prescribed creams lighten them over time.

Set 3

No.	Question	Answer

No.	Question	Answer
1	**How can I manage dry skin in winter?**	Use a thick moisturiser right after bathing, avoid very hot water and choose mild soaps. Cracked or itchy skin may need a medicated cream.
2	**What are the warning signs of skin cancer?**	A mole that changes size, shape or colour, a sore that does not heal, or a new shiny bump should be checked. Early detection allows easy treatment.
3	**What is rosacea?**	It causes redness, flushing and small bumps on the face, often triggered by heat, spice and alcohol. Gentle skincare and prescribed treatments keep it calm.
4	**How do I treat nail fungus?**	It makes nails thick, yellow and brittle and needs weeks to months of medicine. Keeping feet dry and trimming nails helps prevent it.
5	**Can stretch marks be prevented?**	They come from fast stretching of skin during growth, pregnancy or weight change and are partly genetic. Moisturising helps comfort, and early treatments can fade them.
6	**Do fairness creams really work?**	They can lighten skin temporarily but many contain harmful steroids or mercury. Sun protection and treating the cause of dark patches is safer.

Set 4

No.	Question	Answer
1	**What are boils and how should I treat them?**	Boils are painful pus filled lumps caused by bacteria in hair follicles. Warm compresses help, but never squeeze them, and recurring boils need medical review.
2	**What is shingles and who gets it?**	Shingles is a painful blistering rash caused by the chickenpox virus reactivating, mostly in adults over 50. Early antiviral medicine reduces pain, and a vaccine is available.
3	**What is alopecia areata?**	It is an immune condition causing round bald patches. Hair often regrows, and treatments can speed it up.
4	**What is contact dermatitis?**	It is a rash from touching things like nickel jewellery, hair dye or detergents. Finding and avoiding the trigger is the key to clearing it.
5	**Why do keloid scars form?**	Some skin heals with excess scar tissue that grows beyond the wound. Injections and other treatments soften them, and early care helps.
6	**Is a prickly heat rash serious?**	It is common in hot humid weather and caused by blocked sweat glands. Cool, loose clothing and calamine lotion usually clear it.

Set 5

No.	Question	Answer

No.	Question	Answer
1	**Do people with darker skin need sunscreen?**	Yes. Darker skin still gets sun damage, pigmentation and skin cancer, though it has some natural protection. A broad spectrum SPF 30 or above is useful.
2	**What causes dark circles under the eyes?**	Genetics, lack of sleep, allergies and thin skin all play a part. Good sleep, sun protection and targeted creams can help.
3	**What is impetigo?**	It is a contagious bacterial infection with honey coloured crusts, common in children. Antibiotic creams or tablets clear it, and keep the child home until treated.
4	**Can acne scars be treated?**	Yes, options like peels, microneedling and laser can smooth scars. Treating the active acne first prevents new scars.
5	**How do I handle cold sores?**	They are small blisters caused by the herpes simplex virus and often return with stress or illness. Antiviral creams started early shorten the episode.
6	**How should I care for an oily skin type?**	Wash twice a day with a mild cleanser and use oil free moisturiser and sunscreen. Skipping moisturiser can make skin produce more oil.

Set 6

No.	Question	Answer
1	**What is seborrheic dermatitis?**	It causes greasy, flaky patches on the scalp, face and chest. Medicated shampoos and creams control it, but it can come and go.
2	**What are the early signs of leprosy?**	Pale or reddish patches with reduced feeling are early signs. It is fully curable with free multidrug treatment, so early care prevents nerve damage.
3	**What causes excessive sweating?**	Hyperhidrosis can be inherited, or linked to thyroid issues or medicines. Strong antiperspirants and other treatments reduce it well.
4	**When should I worry about a mole?**	Use the ABCDE rule: asymmetry, irregular border, colour change, diameter above 6 mm and evolving shape. Any change deserves a skin check.
5	**Why is using steroid creams without advice risky?**	Strong steroid creams can thin skin, cause acne and make fungal infections worse. Use them only as prescribed and for the advised duration.
6	**How do I get rid of head lice?**	Medicated lotions or shampoos with a fine toothed comb remove lice and eggs. Wash bedding in hot water and treat close contacts.

4. Orthopaedics

Set 1

No.	Question	Answer
1	**What causes knee pain and when is surgery needed?**	Osteoarthritis, injury and overuse are common causes. Surgery is considered only when pain and stiffness stay severe despite medicines, physiotherapy and lifestyle measures.
2	**How is osteoarthritis different from rheumatoid arthritis?**	Osteoarthritis is wear and tear of joint cartilage with age. Rheumatoid arthritis is an immune condition that inflames joints, often on both sides of the body.
3	**What are the signs of osteoporosis?**	It is often silent until a fracture occurs. Loss of height, a stooped back and fractures from minor falls are warning signs. A bone density scan confirms it.
4	**How can I manage lower back pain?**	Stay active, avoid long bed rest, improve posture and strengthen core muscles. Pain with leg weakness, numbness or bladder changes needs urgent evaluation.
5	**How long does a fracture take to heal?**	Most fractures heal in 6 to 12 weeks, depending on the bone, age and overall health. Calcium, vitamin D and following activity limits help recovery.
6	**What is a slipped disc and how is it treated?**	A slipped disc presses on a nerve and causes back pain with leg tingling or weakness. Most cases improve with rest, medicines and physiotherapy, and surgery is rarely needed.

Set 2

No.	Question	Answer
1	**What causes neck pain and how can I ease it?**	Poor posture, long screen hours and muscle strain are common causes. Posture correction, gentle stretches and short breaks help, but arm numbness needs a check.
2	**What is a frozen shoulder?**	It is painful stiffness that limits shoulder movement, often after injury or with diabetes. Physiotherapy and exercises restore motion, though recovery takes months.
3	**What is sciatica?**	It is pain travelling from the lower back down the leg due to a pinched nerve. Most cases settle with activity, medicines and physiotherapy.
4	**Why do I get heel pain in the morning?**	Plantar fasciitis causes sharp pain with the first steps of the day. Stretching, supportive footwear and weight control ease it.
5	**What is tennis elbow?**	It is pain on the outer elbow from overuse of the forearm muscles, not only in tennis players. Rest, bracing and strengthening exercises usually fix it.
6	**What is carpal tunnel syndrome?**	A pinched nerve at the wrist causes tingling and numbness in the thumb and fingers, often at night. Wrist splints and sometimes a small procedure give relief.

Set 3

No.	Question	Answer

No.	Question	Answer
1	**What is an ACL injury?**	It is a tear of a key knee ligament, common in sports with sudden turns. Physiotherapy suits some people, and surgery helps active people return to sport.
2	**How do I tell a sprain from a fracture?**	Both cause pain and swelling, but a fracture often brings severe pain on bearing weight, deformity or an inability to use the limb. An X-ray confirms which it is.
3	**Can gout cause joint pain in the knees and feet?**	Yes, high uric acid crystals trigger sudden, severe swelling and pain in joints. Diet changes and medicines prevent repeat attacks.
4	**How is scoliosis detected in children?**	Uneven shoulders, a tilted waist or a visible curve when bending forward are signs. Early checks allow bracing before the curve worsens.
5	**What causes hip pain in adults?**	Arthritis, bursitis, muscle strain and nerve problems can all cause it. Pain with limping or limited movement should be evaluated.
6	**How does vitamin D affect bone health?**	It helps the body absorb calcium to build strong bones. Low levels cause bone pain and weakness, so check levels and take supplements if advised.

Set 4

No.	Question	Answer
1	**What is recovery like after knee replacement?**	Most people walk with support the next day and regain good movement over 6 to 12 weeks. Regular physiotherapy is key to a good result.
2	**What is cervical spondylosis?**	It is age related wear in the neck bones and discs causing stiffness and pain. Exercise, posture changes and medicines manage most cases.
3	**Do flat feet in children need treatment?**	Most flat feet in young children are normal and improve with age. Pain, stiffness or tiredness while walking should be checked.
4	**Why do I get muscle cramps?**	Dehydration, low salts, overexertion and tired muscles can cause cramps. Stretching, fluids and balanced minerals reduce them.
5	**What is trigger finger?**	A finger catches or locks when bending because the tendon sheath is thickened. Rest, splints or an injection often help.
6	**What first aid should I give for a sports injury?**	Use rest, ice for 15 to 20 minutes, a compression bandage and elevation. Severe pain or an inability to bear weight needs an X-ray.

Set 5

No.	Question	Answer

No.	Question	Answer
1	**Is cracking my knuckles or joints harmful?**	Joint cracking is usually harmless and caused by gas bubbles. Pain or swelling with the sound should be checked.
2	**What is knee arthroscopy?**	It is a keyhole procedure to see and repair problems inside the knee, like some cartilage or meniscus tears. Recovery is quicker than open surgery.
3	**What are the signs of a bone infection?**	Persistent bone pain, fever, swelling and warmth over a bone need quick attention. Early antibiotics prevent lasting damage.
4	**What is a rotator cuff injury?**	It is a tear or inflammation of the shoulder muscles and tendons, causing pain when lifting the arm. Many heal with physiotherapy, and some need surgery.
5	**What is ankylosing spondylitis?**	It is an inflammatory arthritis that causes back stiffness, mainly in young men, worse in the morning and better with movement. Early treatment prevents spine fusion.
6	**How should I sit at a desk to protect my back?**	Keep feet flat, back supported and screen at eye level, with breaks every 30 to 45 minutes. Walking and stretching during the day matter as much as the chair.

Set 6

No.	Question	Answer
1	**What is a stress fracture?**	It is a tiny crack in a bone from repeated strain, common in runners and athletes. Rest and gradual return to activity lets it heal.
2	**Can clubfoot in babies be corrected?**	Yes, gentle casting and bracing started in early weeks corrects most cases without major surgery. Early treatment gives normal walking.
3	**Why is a hip fracture serious in older adults?**	It can limit mobility and raise other health risks. Surgery within a day or two and early walking improve recovery.
4	**How does physiotherapy help bone and joint problems?**	It strengthens muscles, improves flexibility and corrects movement habits. Many conditions improve without surgery when physiotherapy is followed regularly.
5	**When is a lump on a bone or limb a concern?**	A lump that grows, is painful at night or is firm and fixed needs a scan. Most are harmless, but early checking is wise.
6	**Do calcium supplements prevent weak bones?**	They help when diet is low in calcium, but they work best with vitamin D and weight bearing exercise. Take the amount advised and not more.

5. Gynaecology and Obstetrics

Set 1

No.	Question	Answer
1	**What causes irregular periods?**	Stress, weight changes, thyroid problems and PCOS are common causes. Cycles that are consistently irregular or very heavy should be evaluated.
2	**What is PCOS and how is it managed?**	PCOS is a hormonal condition causing irregular periods, acne and excess hair growth. Weight management, exercise and medicines help control symptoms and protect fertility.
3	**What care is important in early pregnancy?**	Take folic acid, eat balanced meals, avoid alcohol and tobacco, and begin regular antenatal visits. Bleeding or severe pain needs prompt attention.
4	**When should a couple seek help for infertility?**	After 12 months of trying without success, or 6 months if the woman is over 35. Evaluation covers both partners.
5	**What are the symptoms of fibroids?**	Heavy periods, pelvic pressure, frequent urination and pain are common. Many fibroids need only monitoring, while others are treated with medicines or surgery.
6	**How often should women get a cervical cancer screening?**	A Pap smear or HPV test is usually advised from age 21 to 25, repeated every 3 to 5 years. The HPV vaccine adds strong protection.

Set 2

No.	Question	Answer
1	**Why do I get painful periods?**	Cramps come from uterine contractions, but severe pain may signal endometriosis or fibroids. Heat, light exercise and pain relief help, and persistent pain should be checked.
2	**What counts as heavy menstrual bleeding?**	Soaking a pad every hour, passing large clots or bleeding beyond 7 days is heavy. It can cause anaemia, so evaluation and treatment help.
3	**What is endometriosis?**	Tissue like the womb lining grows outside the uterus, causing pain and sometimes fertility problems. Medicines, and sometimes keyhole surgery, bring relief.
4	**What happens at menopause and how can symptoms be eased?**	Periods stop and hot flushes, sleep trouble and mood changes are common around age 45 to 55. Lifestyle changes and treatments can ease symptoms.
5	**What is gestational diabetes?**	It is high blood sugar first found in pregnancy and is screened for at around 24 to 28 weeks. Diet, activity and sometimes medicines protect mother and baby.
6	**When is vaginal discharge a sign of infection?**	Normal discharge is clear or white and odourless. Itching, a bad smell, colour change or burning suggests infection that needs treatment.

Set 3

No.	Question	Answer

No.	Question	Answer
1	**Why do urinary infections affect women more?**	A shorter urethra makes it easier for bacteria to enter. Drinking water, not holding urine and good hygiene help prevent them.
2	**What should I do if I find a breast lump?**	Most lumps are harmless, but all need an exam and often an ultrasound or mammogram. Monthly self checks help you notice changes early.
3	**How can I cope with morning sickness?**	Eat small frequent meals, take ginger, drink fluids and avoid triggers. Severe vomiting that stops you keeping fluids down needs treatment.
4	**What are ovarian cysts and when are they a concern?**	Most are fluid filled sacs that vanish on their own. Large cysts or those causing severe pain need evaluation.
5	**How do I choose a contraceptive method?**	Options include pills, copper devices, hormonal devices, condoms and permanent methods. The best choice depends on your health, age and plans.
6	**Why is anaemia common in pregnancy and how is it prevented?**	Pregnancy raises the body's iron needs. Iron and folic acid tablets with iron rich foods keep haemoglobin healthy.

Set 4

No.	Question	Answer
1	**What is preeclampsia?**	It is high blood pressure with protein in urine after 20 weeks of pregnancy. Headache, blurred vision or swelling need urgent care, and regular checks catch it early.
2	**Why is breastfeeding recommended?**	Breast milk gives the baby ideal nutrition and protection from infections. It also helps the mother recover and lowers some health risks.
3	**What is postpartum depression?**	It is persistent sadness, anxiety or detachment after childbirth beyond the first 2 weeks. It is common and treatable, so support and care matter.
4	**How is normal delivery different from caesarean?**	Normal delivery is vaginal with quicker recovery, while a caesarean is surgery chosen when it is safer for mother or baby. Your doctor advises based on your situation.
5	**What causes a miscarriage?**	Most early miscarriages result from chromosomal problems in the baby and are not caused by anything the mother did. Support and follow up care help recovery.
6	**Why do thyroid tests matter in pregnancy?**	Untreated thyroid problems can affect the baby's brain development and the pregnancy. Simple tablets keep levels normal.

Set 5

No.	Question	Answer

No.	Question	Answer
1	**What is premenstrual syndrome?**	PMS brings mood swings, bloating and breast tenderness in the days before a period. Exercise, balanced meals and sleep help, and severe cases can be treated.
2	**Are ultrasound scans safe in pregnancy?**	Yes, ultrasound uses sound waves and has no known harm to the baby. Scans check growth, position and wellbeing.
3	**How many baby movements are normal?**	Most mothers feel regular movement from around 18 to 22 weeks. A clear drop in movement later in pregnancy should be checked the same day.
4	**Is exercise safe during pregnancy?**	In most healthy pregnancies, walking, yoga and light strength work are good for energy and delivery. Avoid contact sports and stop for pain or bleeding.
5	**Why do vaginal infections keep coming back?**	Diabetes, antibiotics, tight clothes and hormonal changes can cause repeats. Cotton underwear, hygiene and treating the cause reduce them.
6	**What is premature menopause?**	Periods stopping before age 40 is premature ovarian insufficiency. It needs hormone tests and treatment to protect bones and heart.

Set 6

No.	Question	Answer
1	**How does IVF work?**	Eggs are collected, fertilised in a lab and the embryo is placed in the womb. It helps couples when other fertility treatments have not worked.
2	**What is the pelvic floor and why does it matter?**	These muscles support the bladder, womb and bowel. Pelvic floor exercises help prevent leaking after childbirth and with age.
3	**What is uterine prolapse?**	The womb slips down into the vagina, causing a dragging feeling. Exercises, a pessary or surgery treat it well.
4	**What is an ectopic pregnancy?**	The embryo grows outside the womb, usually in a tube, causing one sided pain and bleeding. It is an emergency that needs prompt treatment.
5	**How should a mother care for herself after delivery?**	Rest, nutritious meals, fluids, gentle walking and support from family help recovery. Fever, heavy bleeding or wound pain need medical attention.
6	**How can teenage girls manage periods hygienically?**	Change pads every 4 to 6 hours, wash hands and use clean cloths or sanitary products. Talking openly about periods removes myths and shame.

6. Paediatrics

Set 1

No.	Question	Answer
1	**Which vaccines does my child need and when?**	Children follow a national immunisation schedule from birth, covering diseases like polio, measles, hepatitis B and tetanus. Keep the vaccination card updated at every visit.
2	**How do I manage fever in a child?**	Keep the child hydrated, dress lightly and give age appropriate fever medicine. Seek care for fever in babies under 3 months, fits, rash, or if the child is unusually drowsy.
3	**What are the signs of dehydration in children?**	Dry mouth, no tears when crying, sunken eyes and fewer wet diapers are signs. Give ORS often and seek care if the child cannot keep fluids down.
4	**How can I tell if my child is growing normally?**	Weight, height and milestone tracking against growth charts shows progress. Delays in speech, walking or social response should be discussed early.
5	**How do I handle frequent colds and coughs in children?**	Young children can get 6 to 8 colds a year, which is normal. Rest, fluids and saline drops help, and breathing difficulty needs prompt attention.
6	**What should I feed my child for healthy growth?**	Exclusive breastfeeding for the first 6 months, then iron rich and varied complementary foods. Limit sugary drinks and packaged snacks.

Set 2

No.	Question	Answer
1	**What should I do when my child has loose motions?**	Give ORS and fluids often, keep feeding and add zinc as advised. Blood in stool, high fever or signs of dehydration need prompt care.
2	**Why does my child wet the bed at night?**	It is common up to age 5 to 7 and often runs in families. Avoid punishment, limit fluids late evening and seek advice if it continues beyond that age.
3	**How do I recognise and treat worms in children?**	Itching around the bottom, belly pain and poor weight gain can point to worms. A simple deworming tablet and good hand hygiene clear them.
4	**How can I tell if my child has asthma?**	Repeated cough or wheeze at night, with exercise or after colds suggests asthma. Inhalers keep it controlled so children can play freely.
5	**Is newborn jaundice normal?**	Mild yellowing in the first week is common and settles. Yellowness that appears in the first day, spreads or lasts long needs checking.
6	**How can I ease my baby's teething?**	Give a clean cold teether and gently massage the gums. Mild irritability is normal, and high fever is not caused by teething.

Set 3

No.	Question	Answer

No.	Question	Answer
1	**Why do children get ear infections?**	Their short ear tubes let germs travel from the throat easily, often after a cold. Earache with fever needs a doctor check, and avoid putting oil or drops in without advice.
2	**What can I do about a picky eater?**	Offer small portions of varied foods without pressure or screens. Keep meals regular and avoid filling up on snacks and milk.
3	**How much screen time is healthy for children?**	Avoid screens under 18 months and limit to about an hour a day for young children. Play, sleep and conversation support brain growth better.
4	**How is chickenpox managed in children?**	Fluid filled itchy blisters appear with mild fever, and rest and fever care help. Keep the child at home until blisters dry, and the vaccine prevents it.
5	**How do I know if my child is anaemic?**	Paleness, tiredness, poor appetite and low concentration are signs. Iron rich foods and supplements prescribed after a blood test correct it.
6	**How should I treat constipation in children?**	Increase fibre, water and fruits, and set a regular toilet routine. Long lasting constipation or pain needs medical advice.

Set 4

No.	Question	Answer
1	**What should I do if my child has a febrile seizure?**	Lay the child on their side, keep the area safe and do not put anything in the mouth. Most are brief and harmless, but seek care after the first one.
2	**When should I worry about speech delay?**	No babbling by 12 months or few words by 18 to 24 months should be checked. Hearing tests and early therapy bring big gains.
3	**How can food allergies in children be recognised?**	Hives, vomiting, swelling or breathing trouble soon after eating suggest allergy. Avoid the trigger and get emergency help for breathing difficulty.
4	**What is hand, foot and mouth disease?**	A viral illness with fever, mouth ulcers and blisters on hands and feet, common in young children. It settles in about a week with fluids and rest.
5	**Do frequent tonsillitis episodes need surgery?**	Most children outgrow them. Surgery is considered only for very frequent, severe infections despite treatment.
6	**How much sleep does my child need?**	Toddlers need 11 to 14 hours and school children 9 to 11 hours. A fixed bedtime routine without screens helps sleep.

Set 5

No.	Question	Answer

No.	Question	Answer
1	**How do I prevent obesity in children?**	Offer home cooked meals, limit sugary drinks and snacks and encourage an hour of play daily. Family habits matter most.
2	**What are early signs of ADHD?**	Constant restlessness, trouble focusing and impulsive behaviour beyond what is expected for age may suggest ADHD. Early assessment guides support at home and school.
3	**What causes rickets in children?**	Lack of vitamin D, calcium or sunlight softens bones, causing bowed legs and delayed walking. Supplements and sunlight prevent and treat it.
4	**Why is the measles vaccine so important?**	Measles can cause pneumonia, brain swelling and death. Two doses give strong lifelong protection.
5	**What are the signs of bronchiolitis in babies?**	Fast breathing, wheeze and feeding difficulty after a cold suggest it. Babies who breathe hard or feed poorly need quick medical care.
6	**When should my child start brushing teeth?**	Begin as soon as the first tooth appears, using a rice grain sized smear of fluoride paste. Limit sweets and avoid bottles at bedtime to prevent cavities.

Set 6

No.	Question	Answer
1	**How can I tell if my child has a vision problem?**	Squinting, sitting close to the TV, headaches and eye rubbing are clues. Vision screening in early years prevents a lazy eye.
2	**How should I care for a newborn's umbilical cord?**	Keep it clean and dry, and let it fall off on its own in 1 to 2 weeks. Redness, pus or a bad smell needs a check.
3	**What is colic and how can I soothe my baby?**	Colic is long episodes of crying in a healthy baby in the first months. Holding, gentle rocking and burping help, and it passes by about 4 months.
4	**How do I protect my child from dengue?**	Prevent mosquito breeding by emptying standing water, and use nets and full sleeves. Persistent fever with vomiting or rash needs a doctor visit.
5	**How should I handle toddler tantrums?**	Stay calm, keep the child safe and avoid giving in. Praise good behaviour and help them name feelings.
6	**Why do babies need tummy time?**	It builds neck, shoulder and back strength for rolling and crawling. Start with a few minutes while the baby is awake and supervised.

7. ENT

Set 1

No.	Question	Answer
1	**What causes recurrent sore throat and tonsillitis?**	Viral and bacterial infections are the usual causes. Tonsil removal is considered only after repeated, severe episodes that affect daily life.
2	**How is hearing loss detected and treated?**	An audiometry test measures hearing. Treatment ranges from wax removal and medicines to hearing aids or surgery, based on the cause.
3	**What causes sinusitis and how long does it last?**	Infection or allergy blocks the sinuses, causing facial pain, congestion and headache. Acute sinusitis clears in 2 to 3 weeks, while chronic cases need longer treatment.
4	**Why do I have ear pain and discharge?**	Middle ear infections and swimmer's ear are common causes. Avoid putting anything into the ear and get it examined, especially in children.
5	**What are the causes of snoring and sleep apnoea?**	Blocked airways, obesity, enlarged tonsils or a deviated septum are common causes. Pauses in breathing with daytime sleepiness suggest sleep apnoea and need a sleep study.
6	**How can vertigo and dizziness be treated?**	Inner ear problems like BPPV are a common cause and respond well to simple repositioning manoeuvres. Dizziness with weakness or speech trouble needs emergency care.

Set 2

No.	Question	Answer
1	**What causes a blocked nose that does not clear?**	Allergies, a deviated septum, nasal polyps or long standing sinus inflammation are common causes. Identifying the cause with a nasal examination helps choose the right sprays, medicines or procedure.
2	**How should I clean my ears safely?**	Wipe only the outer ear with a soft cloth and avoid cotton buds, pins or hairclips, which push wax deeper and can injure the eardrum. Wax that blocks hearing can be softened with drops and removed safely by a specialist.
3	**What is tinnitus and can it be treated?**	Tinnitus is a ringing or buzzing sound in the ear without an outside source. Treating the cause, such as wax or hearing loss, along with sound therapy and stress control often reduces it.
4	**Why does my child keep getting ear infections?**	Small, narrow ear tubes drain poorly in children, especially with colds, allergies or enlarged adenoids. Treating the trigger and finishing prescribed medicines lowers repeat infections.
5	**What causes nosebleeds and how are they stopped?**	Dry air, nose picking, allergies and high blood pressure are common causes. Sit upright, lean forward and pinch the soft part of the nose for 10 minutes; seek care if bleeding continues.
6	**What causes a hoarse voice that lasts for weeks?**	Voice overuse, reflux, smoking and infections can inflame the vocal cords. Hoarseness lasting beyond 3 weeks needs a throat examination to rule out serious causes.

Set 3

No.	Question	Answer
1	**What is allergic rhinitis and how is it controlled?**	It is an allergy of the nose causing sneezing, runny nose and itching, often triggered by dust, pollen or pets. Avoiding triggers, saline rinses and prescribed sprays or antihistamines bring good control.
2	**What is a deviated septum?**	It is a bent wall between the two nostrils that can block airflow on one side. Mild cases need no treatment, while a surgery called septoplasty corrects severe blockage.
3	**What causes sudden hearing loss?**	It can follow a viral infection, injury or a problem in the inner ear nerve. It is an emergency, and starting treatment within 72 hours gives the best chance of recovery.
4	**What are nasal polyps?**	They are soft, painless swellings inside the nose caused by long term inflammation. Sprays and medicines shrink many polyps, and surgery helps when they keep blocking breathing.
5	**Why do I feel a lump in my throat?**	Acid reflux, throat muscle tension and post nasal drip are common causes. If the feeling comes with swallowing trouble, weight loss or a neck lump, get it examined.
6	**What should I do if a child puts a bead or seed in the nose or ear?**	Stay calm, do not poke at it and avoid attempts to pull it out at home. Get it removed promptly by a trained specialist to prevent injury or infection.

Set 4

No.	Question	Answer
1	**What causes loss of smell and can it return?**	Viral infections, nasal blockage and head injury are common causes. Smell often returns once the cause is treated, and smell training exercises can speed recovery.
2	**How can I protect my ears from loud noise?**	Keep earphone volume below 60% and take listening breaks. Use ear protection at concerts, around machinery and during firecracker festivals.
3	**What is Meniere's disease?**	It is an inner ear condition causing spinning vertigo, ringing and fluctuating hearing loss. Low salt diet, medicines and stress control help manage the attacks.
4	**What causes difficulty swallowing?**	Throat infections, reflux, nerve problems or growths can make swallowing hard or painful. Trouble that persists for more than 2 weeks needs a proper examination.
5	**What is post nasal drip and why does it cause a cough?**	Mucus from the nose and sinuses trickles down the throat, causing throat clearing and a nagging cough, often worse at night. Treating the allergy or sinus cause and using saline rinses brings relief.
6	**What is glue ear in children and how is it treated?**	It is fluid trapped behind the eardrum that muffles hearing and can affect speech and school. Many cases clear on their own, and a small ventilation tube restores hearing when they do not.

Set 5

No.	Question	Answer

No.	Question	Answer
1	**What are the warning signs of throat and mouth cancer?**	A sore or ulcer that does not heal in 3 weeks, persistent hoarseness, a neck lump or painful swallowing are warning signs. Tobacco and betel quid chewing are major causes, and early detection improves cure rates.
2	**What can cause a lump in the neck?**	Infections, enlarged lymph nodes and thyroid swellings are the common causes. A lump lasting over 2 weeks, or growing steadily, should be examined and tested.
3	**Does steam inhalation cure a sinus infection?**	Steam can ease congestion for a short time but it does not cure the infection. Saline rinses and prescribed treatment tackle the underlying cause.
4	**What are enlarged adenoids in children?**	Adenoids are tissue behind the nose that can swell and cause mouth breathing, snoring and repeated ear infections. Medicines help mild cases, and removal is advised when symptoms persist.
5	**Do hearing aids restore normal hearing?**	Hearing aids amplify sound and make speech clearer, but they do not restore hearing completely. Early use and proper fitting help the brain adapt and improve daily communication.
6	**What is silent reflux of the throat?**	Stomach acid reaches the throat and voice box without typical heartburn, causing throat clearing, cough and hoarseness. Smaller meals, avoiding late dinners and prescribed medicines settle it.

Set 6

No.	Question	Answer
1	**Can a perforated eardrum heal on its own?**	Many small holes close by themselves within weeks if the ear is kept dry and free of infection. Large or persistent holes may need a small repair surgery to restore hearing.
2	**When is sinus surgery recommended?**	Surgery is considered when sinusitis keeps returning or persists despite 3 months of proper medical treatment. Modern endoscopic surgery opens the blocked passages through the nose without outside cuts.
3	**Why do my ears feel blocked during flights?**	Changing air pressure can stop the ear tube from equalising, causing a blocked feeling or pain. Swallowing, chewing and gentle yawning help, and a cold or allergy should be treated before flying.
4	**Can nasal decongestant sprays be used for a long time?**	Using them for more than 5 days can cause rebound congestion that worsens the blockage. Saline or steroid sprays are safer choices for longer use.
5	**What are tonsil stones and are they harmful?**	They are small white lumps that collect in the tonsil folds and can cause bad breath. They are usually harmless and are managed with gargling and good oral hygiene.
6	**How can I reduce ear, nose and throat problems in monsoon and polluted seasons?**	Wash hands, keep the nose clear with saline rinses, wear a mask on high pollution days and avoid very cold drinks if they trigger you. Keep ears dry after bathing and treat colds early.

8. Ophthalmology

Set 1

No.	Question	Answer
1	**What are the early signs of cataract?**	Blurry or cloudy vision, glare at night and fading colours are early signs. Surgery to replace the lens restores clear vision and is a safe, routine procedure.
2	**How does diabetes affect the eyes?**	High blood sugar can damage retinal blood vessels, a condition called diabetic retinopathy. A yearly dilated eye exam catches it early, often before symptoms appear.
3	**What is glaucoma and why is it called the silent thief of sight?**	Glaucoma raises eye pressure and damages the optic nerve without early symptoms. Vision lost cannot be restored, so regular screening after 40 is important.
4	**How can I reduce digital eye strain?**	Follow the 20-20-20 rule: every 20 minutes, look 20 feet away for 20 seconds. Adjust screen brightness, blink often and keep the screen at arm's length.
5	**When should a child's eyes be tested?**	A first check around 3 years of age is advised, earlier if there is a squint or family history. Frequent squinting, headaches or sitting close to the screen are warning signs.
6	**What causes red, itchy or watery eyes?**	Allergies, infections and dryness are common causes. Avoid rubbing and sharing towels, and get checked if there is pain, discharge or vision change.

Set 2

No.	Question	Answer
1	**What is dry eye disease and how is it treated?**	It happens when eyes do not make enough quality tears, causing burning, grittiness and watering. Lubricating drops, blinking breaks and treating eyelid problems give lasting comfort.
2	**What are eye floaters and are they harmful?**	Floaters are tiny specks or threads drifting across vision, usually from normal ageing of the jelly inside the eye. A sudden shower of floaters with flashes of light needs an urgent retina check.
3	**What is myopia and why is it rising among children?**	Myopia, or short sightedness, makes distant objects blurry. More screen time and less outdoor play are linked to it, so about 2 hours outdoors daily helps protect children's eyes.
4	**How can I use contact lenses safely?**	Wash hands before handling them, never sleep or swim in them and replace them on schedule. Remove lenses at once if the eye turns red or painful.
5	**What is a stye and how is it treated?**	A stye is a painful lump on the eyelid edge caused by an infected oil gland. Warm compresses several times a day usually clear it, and do not squeeze it.
6	**Is LASIK safe and who is a candidate?**	LASIK is a well established laser procedure that reduces dependence on glasses in suitable eyes. Stable power, healthy corneas and a thorough pre procedure assessment decide who qualifies.

Set 3

No.	Question	Answer
1	**What is age related macular degeneration?**	It damages the central part of the retina, blurring or distorting fine detail like faces and text. Early detection, a diet rich in leafy greens and treatments such as eye injections can protect sight.
2	**What is lazy eye in children?**	Lazy eye, or amblyopia, is reduced vision in one eye because the brain favours the other. Early glasses, patching or drops before about 8 years of age can restore good vision.
3	**What should I do if chemicals or dust get into the eye?**	Rinse the eye immediately with plenty of clean running water for at least 15 minutes and do not rub. Seek emergency eye care after rinsing, especially for chemicals.
4	**What is presbyopia and why do I need reading glasses after 40?**	The eye lens gradually stiffens with age and cannot focus on near objects. Reading glasses or multifocal lenses easily correct it and it is a normal part of ageing.
5	**Can a squint be corrected in adults?**	Yes. Adult squints can often be improved with glasses, prism lenses or surgery, which also improves appearance and confidence. Sudden onset of a squint or double vision needs urgent assessment.
6	**What is night blindness and what causes it?**	Difficulty seeing in dim light can come from vitamin A deficiency, cataract or inherited retinal conditions. Testing finds the cause, and many cases improve once it is treated.

Set 4

No.	Question	Answer
1	**Do carrots really improve eyesight?**	Carrots contain vitamin A that supports eye health, but they will not correct poor vision caused by refractive errors. Glasses or lenses are needed for that.
2	**Can reading in dim light damage the eyes?**	It can cause tired eyes and headache but it does not cause permanent damage. Good lighting makes reading more comfortable.
3	**What is colour blindness?**	It is difficulty telling certain colours apart, usually inherited and more common in boys. Simple tests detect it, and early knowledge helps with school and career planning.
4	**How should I care for my eyes after cataract surgery?**	Use prescribed drops on time, avoid rubbing the eye and keep water and dust out for the first weeks. Wear protective glasses and attend follow up checks.
5	**What causes eyelid twitching?**	Stress, lack of sleep, caffeine and eye strain are the usual triggers and it settles on its own. Twitching that lasts weeks or closes the eye fully should be checked.
6	**What is keratoconus?**	It is a condition where the clear front of the eye thins and bulges into a cone shape, blurring vision. Corneal cross linking can stop its progress when detected early.

Set 5

No.	Question	Answer

No.	Question	Answer
1	**How does high blood pressure affect the eyes?**	Long standing high pressure can damage retinal vessels and cause bleeding or swelling, called hypertensive retinopathy. A routine eye exam can reveal it, and controlling blood pressure protects vision.
2	**Is it safe to use steroid eye drops without advice?**	No. Steroid drops used without supervision can raise eye pressure and cause cataract or infection spread. Use eye drops only as prescribed and for the advised duration.
3	**What eye problems can affect premature babies?**	Premature babies can develop retinopathy of prematurity, where retinal vessels grow abnormally. Timely screening in the first weeks of life allows treatment that saves sight.
4	**What causes double vision?**	Weak eye muscles, nerve problems, cataract or dry eye can all cause it. Double vision that appears suddenly can signal a nerve or brain problem and needs urgent assessment.
5	**How does eye donation restore sight?**	Donated corneas are transplanted to people whose vision is lost from corneal damage. Donation must happen within hours of death, so families should know the pledge decision.
6	**What is pterygium?**	It is a fleshy growth on the white of the eye that can spread onto the cornea, linked to sun, dust and wind exposure. Sunglasses and lubricating drops help, and surgery removes growths that affect vision.

Set 6

No.	Question	Answer
1	**What is blepharitis?**	It is chronic inflammation of the eyelid edges that causes redness, crusting and irritation. Daily lid cleaning and warm compresses keep it under control.
2	**How often should adults have a complete eye check?**	Adults with no problems can have a check every 2 years, and yearly after 40 or with diabetes. Regular checks catch quietly progressing conditions early.
3	**Do glasses weaken the eyes?**	No. Glasses simply correct focusing errors and do not make the eyes dependent. Wearing the right power helps children learn and avoids strain.
4	**What causes sudden loss of vision in one eye?**	Blocked retinal blood flow, retinal detachment, bleeding or optic nerve problems can be responsible. It is an emergency, and getting care within hours can save vision.
5	**How can I protect my eyes from ultraviolet rays?**	Wear sunglasses that block 100% of UV rays and a wide brimmed hat outdoors. Long term UV exposure raises the risk of cataract and growths on the eye.
6	**How can I keep my eyes safe during Holi and Diwali?**	Use herbal colours, wear protective glasses and keep a safe distance from fireworks. If colour or a spark enters the eye, rinse with clean water and seek urgent eye care.

9. Neurology

Set 1

No.	Question	Answer
1	**What are the warning signs of a stroke?**	Sudden face drooping, arm weakness and slurred speech are key signs. Act FAST and reach a hospital within hours, as early treatment limits brain damage.
2	**What triggers migraine and how can it be managed?**	Stress, poor sleep, skipped meals and certain foods are common triggers. A headache diary, lifestyle changes and preventive or acute medicines help control attacks.
3	**What is epilepsy and can people live normally with it?**	Epilepsy is a condition of repeated seizures caused by abnormal brain activity. With regular medicines, most people live full and active lives.
4	**What are the early symptoms of Parkinson's disease?**	Tremor at rest, slow movement, stiffness and a change in handwriting are early signs. Medicines and therapy help manage symptoms for years.
5	**Is memory loss a normal part of ageing?**	Mild forgetfulness can be normal, but losing the way home, repeating questions or struggling with daily tasks may signal dementia and needs assessment.
6	**What causes numbness and tingling in the hands and feet?**	Diabetes, vitamin B12 deficiency and nerve compression are common causes. Persistent or spreading numbness should be evaluated.

Set 2

No.	Question	Answer
1	**Which headaches are dangerous?**	A sudden severe headache, one with fever and neck stiffness, or one with weakness, vision change or fits needs urgent care. A new headache pattern after age 50 should also be checked.
2	**What causes fainting and when is it a concern?**	Dehydration, standing up fast, heat and emotional shock are common harmless causes. Fainting with chest pain, palpitations or during exercise needs a proper heart and brain evaluation.
3	**What should I do if someone has a seizure?**	Keep the person safe on their side, cushion the head and time the seizure. Do not put anything in the mouth or hold them down, and call for emergency help if it lasts over 5 minutes.
4	**How does Alzheimer's disease progress and how can families help?**	It starts with forgetting recent events and slowly affects judgement, speech and daily tasks. Routines, safe surroundings, patience and medicines that slow symptoms improve quality of life.
5	**What is Bell's palsy?**	It is sudden weakness of one side of the face, often after a viral infection. Most people recover within weeks to months, and early medicines plus eye protection improve the outcome.
6	**What causes sciatica and how is it relieved?**	A pinched nerve in the lower back sends pain, tingling or numbness down the leg. Most cases settle with medicines, targeted exercises and posture care.

Set 3

No.	Question	Answer
1	**What is a mini stroke or TIA?**	A TIA causes stroke like symptoms that disappear within minutes to hours because of a temporary blockage. It is a strong warning, so urgent evaluation can prevent a major stroke.
2	**How can stroke be prevented?**	Controlling blood pressure, sugar and cholesterol, quitting tobacco and staying active lowers risk the most. Irregular heartbeats like atrial fibrillation also need treatment.
3	**What is trigeminal neuralgia?**	It causes sudden, electric shock like pain in the face, often set off by touch, chewing or wind. Specific nerve medicines work well, and procedures help when they stop working.
4	**What is multiple sclerosis?**	It is an immune condition in which the body attacks the protective covering of nerves, causing vision problems, weakness or numbness in episodes. Modern medicines reduce relapses and slow progression.
5	**What causes restless legs syndrome?**	An urge to move the legs with crawling sensations, worse at night, is linked to low iron, pregnancy and kidney problems. Treating the cause and gentle evening stretches help.
6	**What causes tremors apart from Parkinson's disease?**	Essential tremor, anxiety, thyroid problems and some medicines can all cause shaking. A specialist can tell them apart, and most types are treatable.

Set 4

No.	Question	Answer
1	**Which tests are used to diagnose brain and nerve conditions?**	MRI and CT scans show the brain and spine, EEG records brain waves and nerve conduction studies test nerves. The test advised depends on the symptoms.
2	**What is meningitis and what are its warning signs?**	It is infection of the coverings of the brain, causing fever, severe headache, neck stiffness and sensitivity to light. It is an emergency and early treatment saves lives.
3	**When is a head injury serious?**	Repeated vomiting, drowsiness, fits, confusion, bleeding from the ear or nose, or a worsening headache after a blow are danger signs. Such injuries need an urgent scan.
4	**What are the warning signs of a brain tumour?**	Headaches that worsen over time, fits, vomiting, vision change and personality shifts can be signs. Imaging confirms the cause, and many tumours are treatable.
5	**What is cerebral palsy?**	It is a group of movement and posture disorders caused by early brain injury around birth. Therapy, supportive devices and early intervention greatly help a child's independence.
6	**What causes muscle weakness that needs neurological attention?**	Weakness that is sudden, one sided, spreading or comes with wasting or twitching can point to nerve or muscle disease. Early testing finds treatable causes.

Set 5

No.	Question	Answer

No.	Question	Answer
1	**Are fever related seizures in children dangerous?**	Febrile seizures are frightening but are usually harmless and do not cause brain damage. Keep the child safe on their side and seek care for a first seizure or one lasting over 5 minutes.
2	**Can epilepsy be treated with surgery?**	When medicines fail to control seizures, tests may find a small area of the brain causing them, and surgery to remove it can stop seizures in many people. A detailed evaluation decides who is suitable.
3	**What is cluster headache?**	It causes extremely severe pain around one eye in repeated bouts, with a watering eye and runny nose. Oxygen therapy and special medicines can stop attacks and prevent cycles.
4	**How does sleep affect brain health?**	Deep sleep helps clear waste from the brain and consolidate memory. Regularly sleeping 7 to 8 hours supports focus, mood and long term brain health.
5	**What are the signs of a brain aneurysm?**	Most are silent, but a sudden thunderclap headache, vomiting or neck pain can signal a leak and needs emergency care. Treatment can seal the weak vessel wall.
6	**How can I keep my brain healthy as I grow older?**	Regular exercise, a balanced diet, social activity, good sleep and managing blood pressure and sugar protect the brain. Learning new skills keeps the mind active.

Set 6

No.	Question	Answer
1	**What is Guillain Barre syndrome?**	It is a condition in which the body's immunity attacks nerves after an infection, causing rapidly spreading weakness starting in the legs. Prompt treatment leads to recovery in most people.
2	**What is neurocysticercosis?**	It is a brain infection from tapeworm cysts, a common cause of fits in India linked to poor hygiene and undercooked pork. Medicines, handwashing and safe food preparation help treat and prevent it.
3	**How long does recovery after a stroke take?**	Most recovery happens in the first 3 to 6 months but can continue for years with rehabilitation. Starting therapy early and staying regular improves results.
4	**When is advanced treatment considered for Parkinson's disease?**	When medicines cause strong swings in symptoms, options such as deep brain stimulation can smooth control. Careful selection is important for good outcomes.
5	**What is cervical spondylosis and how does it cause arm symptoms?**	Age related wear in the neck bones can press on nerves and cause neck pain with tingling or weakness in the arm. Exercises, posture correction and medicines help most people.
6	**Can stress cause neurological symptoms?**	Yes. Stress can cause real symptoms like weakness, tremor, blackouts or numbness without nerve damage, known as functional disorders. Proper assessment, reassurance and therapy lead to recovery.

10. Gastroenterology

Set 1

No.	Question	Answer
1	**What causes acidity and heartburn?**	Spicy or oily food, late meals, stress and a weak valve between the stomach and food pipe are common causes. Smaller meals, avoiding late dinners and medicines help.
2	**What are the symptoms of fatty liver?**	Most people have no symptoms, though some feel tiredness or mild right sided discomfort. Weight loss, exercise and limiting sugar and alcohol can reverse early fatty liver.
3	**How is irritable bowel syndrome different from other gut conditions?**	IBS causes cramps, bloating and altered bowel habits without visible damage to the gut. Diet changes and stress control often bring relief.
4	**What causes constipation and how can it be treated?**	Low fibre, low water intake and inactivity are the usual causes. More fibre, fluids, movement and a regular routine help. Blood in stool or sudden change needs evaluation.
5	**What are the signs of liver disease?**	Yellow eyes or skin, dark urine, abdominal swelling and persistent fatigue are signs. Hepatitis B and C are silent causes that blood tests can detect.
6	**When is an endoscopy or colonoscopy needed?**	They are advised for persistent pain, bleeding, swallowing trouble or unexplained weight loss. A colonoscopy is also used for colon cancer screening from age 45.

Set 2

No.	Question	Answer
1	**What causes diarrhoea and when should I worry?**	Infections, contaminated food or water and some medicines are common causes. Drink ORS to replace fluids and seek care for blood in stool, high fever, severe weakness or symptoms beyond 3 days.
2	**What causes bloating and excess gas?**	Swallowed air, certain foods, constipation and food intolerances are common causes. Eating slowly, limiting fizzy drinks and finding trigger foods usually helps.
3	**What is Helicobacter pylori and how is it treated?**	It is a stomach bacterium linked to gastritis and ulcers, spread through contaminated food and water. A short course of combined medicines clears it and heals the stomach lining.
4	**How do painkillers cause stomach ulcers?**	Regular use of NSAID painkillers weakens the stomach lining and can cause ulcers and bleeding. Take them with food, use the lowest dose and avoid self medication.
5	**What causes persistent nausea and vomiting?**	Infections, acidity, pregnancy, medicines and migraine are among the causes. Vomiting that lasts over a day, contains blood or comes with severe pain needs medical care.
6	**How can hepatitis A and E be avoided?**	They spread through contaminated food and water, especially in monsoon. Drink boiled or filtered water, eat fresh cooked food, wash hands and get the hepatitis A vaccine.

Set 3

No.	Question	Answer
1	**What is hepatitis B and how can it be prevented?**	It is a liver infection spread through blood, unsafe injections and from mother to baby. A 3 dose vaccine gives strong protection and every newborn should receive it.
2	**Is hepatitis C curable?**	Yes. Modern antiviral tablets taken for 8 to 12 weeks cure over 95% of people. A blood test is the only way to find the silent infection.
3	**What causes pancreatitis?**	Gallstones and heavy alcohol use are the main causes, leading to severe upper abdominal pain spreading to the back. It needs prompt medical care and treating the cause prevents repeats.
4	**What is celiac disease?**	It is an immune reaction to gluten in wheat, barley and rye that damages the small intestine, causing bloating, diarrhoea and poor growth. A strict gluten free diet restores health.
5	**What are the symptoms of lactose intolerance?**	Bloating, gas and loose stools after milk or milk products signal it. Lactose free products, curd and smaller portions are often well tolerated.
6	**What are Crohn's disease and ulcerative colitis?**	They are chronic immune conditions causing bowel inflammation with pain, diarrhoea, blood in stool and weight loss. Modern medicines can bring long periods of remission.

Set 4

No.	Question	Answer
1	**What causes blood in the stool and when is it worrying?**	Piles and fissures are common causes, but infections, polyps, colitis and cancer can also be responsible. Any ongoing bleeding needs examination rather than self treatment.
2	**How does alcohol harm the liver?**	Alcohol causes fat build up, inflammation and eventually scarring of the liver. Stopping or cutting down early can allow the liver to recover.
3	**What is cirrhosis and can it be reversed?**	Cirrhosis is permanent scarring of the liver from long term damage by hepatitis, alcohol or fatty liver. Treating the cause can stop it from worsening and protects remaining liver function.
4	**What causes upper abdominal discomfort after meals?**	Functional dyspepsia, gastritis, ulcers and gallbladder problems can cause fullness or pain after eating. Eating smaller meals and finding triggers helps, and persistent pain needs testing.
5	**Do probiotics help gut health?**	Probiotics can help in some cases, such as diarrhoea after antibiotics. Curd and fermented foods are a natural source, and most people do not need expensive supplements.
6	**How should food poisoning be treated?**	Rest and sip ORS, coconut water or clear fluids to replace losses. Seek care if there is blood, high fever, dehydration or illness lasting beyond 2 days.

Set 5

No.	Question	Answer
1	**What causes abdominal pain that keeps returning?**	Acidity, IBS, ulcers, gallstones and food intolerances can all cause recurrent pain. Where and when the pain occurs guides the tests needed.
2	**What is a hiatus hernia?**	Part of the stomach slips up through the diaphragm, causing reflux, belching and chest discomfort. Lifestyle changes and medicines control most cases, and surgery is rarely needed.
3	**What are the symptoms of colon cancer?**	Blood in stool, a lasting change in bowel habit, unexplained weight loss and iron deficiency anaemia can be signs. Screening from age 45 detects it early when cure is most likely.
4	**What do raised liver enzymes mean?**	Raised enzymes on a liver function test show liver irritation from fatty liver, viruses, alcohol or medicines. Finding the cause is important, and levels often improve once it is treated.
5	**What is an anal fissure?**	It is a small tear in the anal lining causing sharp pain and a little bright red blood during stools. Fibre, water, warm sitz baths and prescribed ointments heal most fissures.
6	**Can fasting or detox diets heal the gut?**	There is little evidence that detox diets help, and extreme versions can cause weakness and imbalance. A balanced diet with fibre, fluids and regular meals supports the gut better.

Set 6

No.	Question	Answer
1	**Is it safe to take acid reducing medicines for a long time?**	They are safe and effective when needed, but long term use should be reviewed regularly. Use the lowest dose for the shortest time and treat the cause of acidity.
2	**What should I eat if I have gastritis?**	Eat small, regular meals and choose bland, low fat foods, and limit spicy food, tea, coffee and alcohol. Staying hydrated and avoiding long gaps between meals soothe the stomach.
3	**What is an anal fistula?**	It is an abnormal tunnel near the anus, usually after an infected gland, causing discharge and recurring pain. It does not heal with medicines alone and is treated with a surgical procedure.
4	**Who should be screened for liver cancer?**	People with cirrhosis or chronic hepatitis B or C benefit from an ultrasound scan and blood test every 6 months. Early detection allows treatments that can cure it.
5	**What is a normal bowel habit?**	Anything from three times a day to three times a week can be normal if stools are soft and easy to pass. A sudden or lasting change from your normal pattern deserves attention.
6	**Can herbal or ayurvedic supplements harm the liver?**	Some herbal products and unregulated remedies can cause serious liver injury. Share every supplement you take with your specialist and avoid long courses without advice.

11. Pulmonology

Set 1

No.	Question	Answer
1	**What causes asthma and how is it controlled?**	Allergens, dust, smoke and cold air trigger airway narrowing. Regular preventer inhalers and trigger avoidance keep most people symptom free.
2	**When should a long-lasting cough be investigated?**	A cough lasting more than 3 weeks, or with blood, weight loss or night sweats, needs testing for tuberculosis and other lung conditions.
3	**What is COPD and who is at risk?**	COPD is a long term lung disease causing breathlessness, mostly from smoking or air pollution. Quitting smoking is the single most effective step.
4	**How is tuberculosis diagnosed and treated?**	Sputum tests and chest X-rays confirm it. TB is curable with a 6 month medicine course that must be completed fully, even after symptoms improve.
5	**How does air pollution affect lung health?**	Fine particles irritate airways and worsen asthma, bronchitis and COPD. Masks on high pollution days, indoor plants and air purifiers can reduce exposure.
6	**What is sleep apnoea and why does it matter?**	Breathing repeatedly stops during sleep, causing loud snoring and daytime tiredness. Left untreated it raises the risk of heart disease and high blood pressure.

Set 2

No.	Question	Answer
1	**What causes breathlessness and when is it an emergency?**	Asthma, infections, anaemia, heart problems and anxiety can all cause it. Sudden breathlessness with chest pain, blue lips, confusion or inability to speak in full sentences needs emergency care.
2	**What is pneumonia and how is it treated?**	It is an infection of the lungs causing fever, cough, chest pain and breathlessness. Antibiotics, rest and fluids treat most cases, and vaccines reduce the risk in children and older adults.
3	**How do I use an inhaler correctly?**	Shake it, breathe out, press as you breathe in slowly and hold your breath for 10 seconds. A spacer makes it easier for children and the elderly and improves how much medicine reaches the lungs.
4	**How long does a cough from bronchitis last?**	Acute bronchitis often leaves a cough lasting up to 3 weeks after the infection clears. Fluids, rest and avoiding smoke help, and a cough beyond that needs checking.
5	**What is a spirometry test?**	It is a simple breathing test where you blow into a device to measure how much air your lungs hold and how fast you can blow it out. It helps diagnose asthma and COPD and track treatment.
6	**Do lungs recover after quitting smoking?**	Yes. Within weeks coughing and breathlessness ease, and over years the risk of lung disease and cancer drops greatly. It is never too late to quit.

Set 3

No.	Question	Answer
1	**What is pulmonary fibrosis?**	It is a scarring of the lung tissue that makes breathing stiff and causes a dry cough and breathlessness. Medicines can slow it, and early diagnosis with a CT scan helps.
2	**What is pleural effusion?**	It is a build up of fluid between the lung and the chest wall that causes breathlessness and chest discomfort. Treatment depends on the cause such as infection, TB or heart problems, and draining the fluid gives quick relief.
3	**What is a pulmonary embolism?**	It is a blood clot that travels to the lungs, causing sudden breathlessness and chest pain. It is an emergency, and long journeys or bed rest raise the risk.
4	**Can dust mite allergy trigger asthma?**	Yes. Dust mites in bedding and soft furnishings are a major trigger. Washing sheets in hot water weekly, using mattress covers and reducing clutter lowers symptoms.
5	**Which vaccines protect the lungs?**	Annual flu vaccine and pneumococcal vaccine reduce the risk of serious chest infections, especially in older adults and those with diabetes or lung disease. They cut severe illness and complications.
6	**How do breathing exercises and pulmonary rehabilitation help?**	Guided breathing, exercise and education improve stamina and reduce breathlessness in chronic lung disease. Simple techniques like pursed lip breathing can be practised at home.

Set 4

No.	Question	Answer
1	**Do inhalers cause dependence?**	No. Inhalers deliver small doses directly to the lungs and are safer than tablets. Using them regularly controls asthma and prevents serious attacks.
2	**What is drug resistant TB?**	It occurs when TB bacteria no longer respond to the usual medicines, often because treatment was incomplete or irregular. It needs specialised testing and a longer course, which is why finishing the full course matters.
3	**What is latent TB?**	The TB germ is present in the body but is inactive, causing no symptoms and no spread. Preventive treatment may be advised for people at high risk of it becoming active.
4	**What are the early signs of lung cancer?**	A cough that does not go away, coughing blood, chest pain, hoarseness and weight loss are signs. Smokers and those exposed to heavy pollution should get early assessment.
5	**How is a chest X-ray different from a CT scan?**	A chest X-ray is a quick first test for infection and fluid. A CT scan gives detailed pictures to find small changes, nodules and scarring.
6	**How can I tell whether breathlessness is from the lungs or the heart?**	Wheeze, cough and phlegm point to the lungs, while breathlessness with chest pressure, swelling of the feet or lying flat suggests the heart. Testing is needed to be sure, so do not delay.

Set 5

No.	Question	Answer
1	**How do vaping and hookah affect the lungs?**	Both expose the lungs to harmful chemicals and fine particles that can cause inflammation, cough and lung injury. They are not safer alternatives to cigarettes.
2	**What is silicosis and who is at risk?**	Silicosis is scarring from breathing silica dust, seen in miners, stone cutters and construction workers. Dust control, masks and regular lung checks protect workers.
3	**What is bronchiectasis?**	It is permanent widening of the airways that traps mucus and causes repeated chest infections and a daily productive cough. Airway clearance exercises and timely antibiotics control it.
4	**What is a normal oxygen level and when is a low reading a concern?**	A normal SpO2 is usually 95% or above. A reading that stays below 92%, or a drop with breathlessness, needs prompt medical advice.
5	**What is a collapsed lung?**	A collapsed lung, or pneumothorax, happens when air leaks into the chest and causes sudden sharp chest pain and breathlessness. It needs urgent assessment and often a tube to remove the air.
6	**Why does cough get worse at night?**	Lying flat allows mucus to drain at the back of the throat and reflux to rise, and asthma tends to flare at night. Raising the head of the bed and treating the cause help.

Set 6

No.	Question	Answer
1	**Why do I have a cough long after a cold or flu?**	Airways stay sensitive for weeks after a viral infection and can cause a dry cough. Warm fluids, steam and rest help, and a cough beyond 8 weeks needs evaluation.
2	**Can children outgrow asthma?**	Many children have fewer symptoms as they grow, but asthma can return later. Regular review and good control protect lung growth.
3	**Can people with asthma exercise?**	Yes, and regular exercise improves lung fitness. Using a reliever inhaler before activity if advised, and warming up well, keeps symptoms in check.
4	**Is it safe to fly or travel to high altitude with a lung condition?**	Many people can, but low oxygen at altitude can worsen breathlessness. Carry your medicines and check your fitness before travel.
5	**Is cough syrup safe for everyone?**	Cough syrups treat symptoms and not the cause, and many are unsuitable for young children. Honey, warm fluids and treating the underlying cause are safer first steps.
6	**How does excess weight affect breathing?**	Extra weight around the chest and belly limits lung expansion and worsens sleep apnoea and asthma. Gradual weight loss often brings clear improvement in breathing.

12. Endocrinology and Diabetology

Set 1

No.	Question	Answer
1	**How is diabetes diagnosed?**	Fasting blood sugar, post meal sugar and HbA1c tests confirm it. An HbA1c of 6.5% or above indicates diabetes.
2	**What is prediabetes and can it be reversed?**	Blood sugar is higher than normal but below the diabetes range. Weight loss, regular activity and a balanced diet can often bring it back to normal.
3	**What are the symptoms of thyroid disorders?**	Underactive thyroid causes weight gain, tiredness and cold intolerance. Overactive thyroid causes weight loss, palpitations and sweating. A TSH test detects both.
4	**How can I keep my blood sugar under control?**	Eat regular balanced meals, stay active, take medicines on time and monitor sugar as advised. Regular HbA1c checks show long term control.
5	**What are the long-term complications of diabetes?**	Uncontrolled sugar can harm the eyes, kidneys, nerves, heart and feet. Good control and yearly screening greatly lower these risks.
6	**How does PCOS relate to hormones and weight?**	PCOS involves insulin resistance and excess androgens, which cause weight gain and irregular periods. Lifestyle change and medicines improve hormone balance.

Set 2

No.	Question	Answer
1	**What is the difference between type 1 and type 2 diabetes?**	Type 1 occurs when the body makes little or no insulin and needs insulin from the start. Type 2 is linked to insulin resistance and lifestyle and is managed with diet, exercise, tablets and sometimes insulin.
2	**What is gestational diabetes?**	It is high blood sugar first found during pregnancy, usually screened at 24 to 28 weeks. Diet, activity and sometimes insulin protect both mother and baby, and sugar often returns to normal after delivery.
3	**What is hypoglycaemia and how is it treated?**	It is low blood sugar causing sweating, shakiness, hunger and confusion. Take 15 grams of fast sugar such as glucose or juice and recheck in 15 minutes.
4	**How should I care for my feet if I have diabetes?**	Check feet daily, wash and dry them well, moisturise and wear well fitting footwear, never walking barefoot. Report any cut, blister or colour change early to prevent serious infections.
5	**What is a good diet for diabetes in Indian meals?**	Fill half the plate with vegetables, choose whole grains, dals and millets over refined rice and limit sweets and fried snacks. Regular portions and timings keep sugar steady.
6	**Is insulin harmful or a last resort?**	Insulin is a safe, natural hormone and an effective medicine, not a sign of failure. Starting it when needed protects the eyes, kidneys and nerves.

Set 3

No.	Question	Answer
1	**How should thyroid tablets be taken for best results?**	Take thyroxine on an empty stomach in the morning with water, 30 to 60 minutes before breakfast. Keep calcium and iron supplements at least 4 hours apart and recheck TSH as advised.
2	**What is a goitre and does iodine matter?**	A goitre is a swelling of the thyroid gland in the neck, often from iodine deficiency or thyroid disease. Using iodised salt prevents deficiency, and tests find the cause of the swelling.
3	**Can thyroid problems affect pregnancy and fertility?**	Yes. Untreated thyroid disease can cause irregular cycles, difficulty conceiving and pregnancy complications. Treatment makes pregnancy safer for mother and baby.
4	**What is vitamin D deficiency and why is it common in India?**	Despite plentiful sunshine, indoor lifestyles, clothing and skin pigmentation lead to widespread deficiency, causing bone pain and muscle weakness. A blood test guides supplements, with safe sun exposure.
5	**Can hormones cause weight gain?**	Thyroid problems, PCOS, Cushing's syndrome and insulin resistance can contribute to weight gain. If weight rises despite healthy habits, hormone testing can help.
6	**What is Cushing's syndrome?**	It is excess cortisol causing weight gain around the trunk, a rounded face, purple stretch marks and high blood sugar. Finding and treating the cause brings the body back to balance.

Set 4

No.	Question	Answer
1	**What is continuous glucose monitoring?**	A small sensor worn on the arm reads sugar levels day and night and shows trends. It helps spot lows and highs and fine tune diet and medicines.
2	**What exercise is best for diabetes?**	A mix of brisk walking, strength training and flexibility work, about 150 minutes a week, lowers sugar and improves insulin response. A short walk after meals is especially helpful.
3	**What is diabetic ketoacidosis?**	It is a dangerous build up of acids from lack of insulin, causing nausea, rapid breathing, abdominal pain and drowsiness. It is an emergency and sick day care and not skipping insulin prevents it.
4	**Can type 2 diabetes go into remission?**	In some people, significant weight loss, healthy eating and activity can bring sugar to normal without medicines. It needs ongoing follow up as it can return.
5	**What are pituitary gland disorders?**	The pituitary controls many hormones, and tumours or damage can cause headaches, vision problems, irregular periods or abnormal growth. Blood tests and a scan help diagnose them, and treatment is available.
6	**What causes short stature in children?**	Genetics, poor nutrition, thyroid problems and growth hormone deficiency can all play a part. Regular growth tracking helps pick out children who need tests.

Set 5

No.	Question	Answer
1	**What is early puberty and when is it a concern?**	Breast development before age 8 in girls or testicular enlargement before 9 in boys is considered early. Evaluation finds the cause, and treatment can protect final height.
2	**What are normal blood sugar levels?**	A normal fasting sugar is below 100 mg/dl and 2 hours after a meal below 140 mg/dl. An HbA1c below 5.7% is normal.
3	**Can people with diabetes eat fruit and sweets?**	Fruits in sensible portions are fine as part of a meal plan, and whole fruit is better than juice. An occasional small sweet can fit if the rest of the day is balanced.
4	**What causes high calcium in the blood?**	An overactive parathyroid gland is the most common cause, leading to kidney stones, bone pain and tiredness. A blood test identifies it and surgery or medicines treat it.
5	**Is fasting safe if I have diabetes?**	Fasting for religious reasons can cause low or very high sugar, so it needs a plan in advance for medicines and meals. Break the fast if sugar drops or you feel unwell.
6	**What is metabolic syndrome?**	It is a cluster of belly fat, high blood pressure, high sugar and abnormal cholesterol that raises the risk of diabetes and heart disease. Weight loss and exercise can reverse it.

Set 6

No.	Question	Answer
1	**What treatments are there for an overactive thyroid?**	Anti thyroid medicines, radioactive iodine and surgery are the main options. The best choice depends on the cause, age and gland size.
2	**How do stress and sleep affect blood sugar?**	Stress hormones and poor sleep raise blood sugar and increase appetite. Regular sleep and relaxation techniques help keep sugar steady.
3	**What is insulin resistance and what are its signs?**	It means the body does not respond well to insulin, so sugar and insulin stay high. Dark velvety skin patches on the neck, belly fat and skin tags are common signs.
4	**Why is diabetes affecting younger Indians?**	Genetic tendency, belly fat, low physical activity and refined food habits raise risk at a younger age. Screening from age 25 to 30 with risk factors allows early action.
5	**What should I do if I have diabetes and fall sick?**	Keep drinking fluids, check sugar more often and continue medicines unless advised otherwise. Seek care for vomiting, sugar that stays very high or drowsiness.
6	**What hormonal changes happen during menopause?**	Falling oestrogen causes hot flushes, mood changes, poor sleep and bone loss. Lifestyle steps, calcium, vitamin D and hormone treatment when suitable ease symptoms.

13. Nephrology

Set 1

No.	Question	Answer
1	**What are the early signs of kidney disease?**	Swelling in feet or face, foamy urine, fatigue and high blood pressure can be early signs. Many people have no symptoms, so urine and creatinine tests matter.
2	**How do diabetes and high blood pressure damage the kidneys?**	Both strain the tiny filters in the kidneys over time. Keeping sugar and blood pressure in range is the best way to protect kidney function.
3	**What causes kidney stones and how can they be prevented?**	Low water intake, excess salt and certain foods contribute. Drinking 2.5 to 3 litres of water daily is the most effective prevention.
4	**What is dialysis and when is it needed?**	Dialysis filters waste from the blood when the kidneys can no longer do so. It is considered in advanced kidney failure, and transplant is another long term option.
5	**Which foods should be limited in chronic kidney disease?**	Salt, potassium rich foods and processed items often need limiting. A kidney specific diet plan keeps waste buildup in check.
6	**Which painkillers and medicines can harm the kidneys?**	Regular use of NSAID painkillers can damage kidneys. Avoid self medication, especially if you have diabetes or kidney disease.

Set 2

No.	Question	Answer
1	**What is eGFR and why does it matter?**	eGFR is a number estimated from a blood creatinine test that shows how well your kidneys are filtering. Tracking it helps catch kidney decline early, when it is easiest to slow down.
2	**Why does protein in the urine need attention?**	Protein leaking into urine is often the first sign that the kidney filters are under strain. Finding it early lets you protect your kidneys with timely treatment.
3	**What is polycystic kidney disease?**	It is an inherited condition in which fluid filled cysts grow in the kidneys over time. Blood pressure control and regular monitoring help protect kidney function.
4	**Can drinking more water cure kidney disease?**	No, water supports healthy kidneys but cannot reverse damage already done. People with advanced kidney disease may even need to limit fluids, so follow personalised advice.
5	**Why do kidney patients often develop anaemia?**	Damaged kidneys make less of the hormone that tells the body to produce red blood cells. Iron and hormone supplements can restore energy and reduce tiredness.
6	**Can children get kidney problems?**	Yes, children can have infections, birth related differences or filter disorders. Puffy eyes, poor growth or repeated urine infections are reasons to get them checked.

Set 3

No.	Question	Answer

No.	Question	Answer
1	**What is nephrotic syndrome?**	It is a condition where the kidneys leak large amounts of protein, causing swelling and foamy urine. Most children respond well to treatment and live normal lives.
2	**How does high uric acid affect the kidneys?**	Too much uric acid can form crystals and stones and may add to kidney strain. Diet changes, water and medicines when needed help keep levels in check.
3	**What is a kidney biopsy and when is it advised?**	A tiny sample of kidney tissue is taken with a thin needle to find the exact cause of kidney trouble. It guides the most precise and effective treatment.
4	**Does a high creatinine level always mean kidney failure?**	Not always, as dehydration, heavy exercise or some medicines can raise it temporarily. Repeat tests and urine checks show whether the kidneys are truly affected.
5	**How does a kidney transplant improve life compared to dialysis?**	A working transplanted kidney does the job around the clock, giving more freedom, energy and fewer diet limits. It needs a suitable donor and lifelong follow up medicines.
6	**Why are swollen feet sometimes a kidney warning?**	When kidneys cannot remove extra salt and water, fluid collects in the feet and around the eyes. Swelling that persists deserves a simple urine and blood test.

Set 4

No.	Question	Answer
1	**What is glomerulonephritis?**	It is inflammation of the kidney filters, which can follow infections or immune conditions and cause blood or protein in urine. Early treatment can protect long term kidney health.
2	**Is it safe to use herbal or ayurvedic remedies with kidney disease?**	Some herbal products contain heavy metals or high potassium that can harm the kidneys. Always check with a specialist before starting any remedy.
3	**How often should people with diabetes get kidney tests?**	A urine albumin test and blood creatinine check at least once a year is advised. Early changes can be treated well before symptoms appear.
4	**What is acute kidney injury?**	It is a sudden drop in kidney function, often triggered by dehydration, infection or certain medicines. Prompt treatment of the cause often allows the kidneys to recover.
5	**Can a single kidney lead a normal life?**	Yes, many people live healthy lives with one kidney as it grows to do extra work. Regular blood pressure and urine checks keep it in good shape.
6	**Why does kidney disease cause itching?**	Waste products that build up in the blood can irritate the skin. Better dialysis, medicines and moisturisers can bring good relief.

Set 5

No.	Question	Answer

No.	Question	Answer
1	**What is hemodialysis versus peritoneal dialysis?**	Hemodialysis cleans blood through a machine, while peritoneal dialysis uses the lining of the belly and can be done at home. The best option depends on your health and daily routine.
2	**How does high salt intake affect kidney health?**	Excess salt raises blood pressure and increases protein loss through the kidneys. Cutting down on pickles, papad and packaged snacks protects them.
3	**What is renal artery stenosis?**	It is a narrowing of the artery supplying a kidney, which can cause stubborn high blood pressure. Imaging tests find it and treatment can restore healthy blood flow.
4	**Are sports supplements and protein powders safe for kidneys?**	Very high protein intake and some supplements can overload the kidneys, especially if they are already weak. Check with a specialist before using them regularly.
5	**What does a urine routine test reveal about the kidneys?**	It can detect protein, blood, sugar, infection and crystals in a quick and painless way. Abnormal results guide the next tests to protect your kidneys.
6	**Can kidney disease be silent for years?**	Yes, kidneys can lose much of their function before any symptoms appear. A yearly blood pressure, creatinine and urine check is the best safeguard.

Set 6

No.	Question	Answer
1	**What is the role of potassium in kidney disease?**	Weak kidneys cannot clear potassium well, and high levels can disturb heart rhythm. Your care team can advise which fruits and vegetables suit you.
2	**How does lupus affect the kidneys?**	Lupus can inflame the kidney filters, a condition called lupus nephritis. Early treatment with immune calming medicines helps protect kidney function.
3	**Is it normal to pass foamy urine sometimes?**	Occasional foam can come from a strong urine stream, but constant foam may mean protein leakage. A simple urine test tells the difference.
4	**What is a fistula for dialysis?**	A fistula is a small surgical link between an artery and a vein in the arm that makes dialysis smooth and safe. It is regarded as the most reliable long term access.
5	**What are the benefits of controlling blood pressure in kidney disease?**	Good blood pressure control can slow kidney damage and lower the risk of heart disease. Most people aim for a target set by their specialist.
6	**Can kidney stones damage the kidneys?**	Large or repeatedly blocking stones can cause infection and lasting kidney damage. Timely treatment and prevention habits keep the kidneys safe.

14. Urology

Set 1

No.	Question	Answer
1	**What are the symptoms of kidney stones?**	Severe pain in the side or back that moves to the groin, blood in urine, nausea and burning urination are typical. Most small stones pass with fluids and medicines.
2	**What causes frequent urination at night in men?**	An enlarged prostate is a common cause after age 50. Diabetes and high fluid intake at night can also contribute and should be evaluated.
3	**What is BPH and how is it treated?**	Benign prostatic hyperplasia is a non cancerous enlargement of the prostate causing weak flow and urgency. Medicines help, and surgery is an option for severe cases.
4	**How can urinary tract infections be prevented?**	Drink plenty of water, do not hold urine and maintain hygiene. Recurrent infections need evaluation for underlying causes.
5	**When should a PSA test be done?**	Men from age 50, or 45 with family history, can discuss PSA screening for prostate cancer. It is a blood test, and results are interpreted with other findings.
6	**What causes male infertility and erectile concerns?**	Lifestyle, stress, diabetes, hormonal issues and infections are common causes. Most are treatable once the cause is found.

Set 2

No.	Question	Answer
1	**What is a urinary tract stone and where can it form?**	Stones are hard mineral deposits that can form in the kidney, ureter or bladder. Most can be treated with medicines or minimally invasive procedures.
2	**What does blood in the urine mean?**	It can come from infection, stones or, less often, tumours of the urinary tract. Even one episode should be evaluated, as early diagnosis improves treatment.
3	**What is lithotripsy?**	It is a procedure using sound waves to break kidney stones into tiny pieces that pass in urine. It is usually done without cuts and recovery is quick.
4	**What is overactive bladder?**	It causes a sudden, strong urge to urinate, often with frequent trips to the toilet. Bladder training and medicines bring good control for most people.
5	**How is prostate cancer detected early?**	A PSA blood test, a physical exam and sometimes an MRI help find it early. Early prostate cancer is often highly treatable.
6	**Why do some people leak urine when they cough or sneeze?**	Weak pelvic floor muscles can cause stress urinary incontinence, common after childbirth and with age. Pelvic exercises and other treatments help greatly.

Set 3

No.	Question	Answer

No.	Question	Answer
1	**What is phimosis in boys and men?**	It is a tight foreskin that cannot be pulled back easily. Gentle creams or a simple minor procedure usually solve it.
2	**What are undescended testicles and why are they treated early?**	One or both testicles fail to settle in the scrotum at birth. Treating this in early childhood protects fertility and lowers later health risks.
3	**What is a varicocele?**	It is a swelling of veins around the testicle that can cause discomfort and reduce sperm quality. Many cases need only monitoring, and treatment is available when needed.
4	**How does diabetes affect urinary and sexual health?**	High sugar can damage nerves and blood vessels, leading to bladder problems and erection difficulty. Good sugar control helps protect both.
5	**Why does urine sometimes smell strong?**	Dehydration, certain foods and infections can change urine odour. If a strong smell comes with burning or fever, get it checked.
6	**Can drinking cranberry juice prevent urine infections?**	Evidence is limited and it is not a replacement for treatment. Drinking enough water and good hygiene are more dependable habits.

Set 4

No.	Question	Answer
1	**What is a kidney tumour and how is it found?**	It is an abnormal growth in the kidney, often discovered by chance on an ultrasound. Many are treated successfully when found early.
2	**What is hematuria without pain and why should it not be ignored?**	Painless blood in the urine can be an early sign of bladder or kidney problems. Prompt tests allow early and effective treatment.
3	**How is a urinary catheter used and is it safe?**	A thin tube drains urine when natural passing is not possible. With proper care it is safe and gives significant comfort and relief.
4	**What is the difference between urinary incontinence types?**	Stress leakage happens with effort, urge leakage comes with a sudden need to go, and mixed forms combine both. Identifying the type helps pick the right treatment.
5	**What is a vasectomy?**	It is a short procedure that blocks the tubes carrying sperm and is a safe, permanent form of male birth control. It does not affect sexual ability or hormones.
6	**Why do men get a weak urine stream with age?**	An enlarging prostate can narrow the urine passage. Medicines or procedures can restore a comfortable flow.

Set 5

No.	Question	Answer

No.	Question	Answer
1	**What are the signs of a urethral stricture?**	A weak, split stream and straining to urinate can point to a narrowed urethra. Treatment can reopen the passage and ease urination.
2	**How can bladder stones be treated?**	They can be broken up and removed with minimally invasive methods. Treating the underlying cause helps prevent them from returning.
3	**What is bladder cancer and what is the main risk factor?**	It starts in the lining of the bladder and often shows as painless blood in urine. Smoking is the biggest risk, and quitting lowers it.
4	**Is it normal to wake up once at night to urinate?**	Once a night is common and usually not a worry. Waking two or more times regularly deserves a check for prostate, sugar or sleep related issues.
5	**What is premature ejaculation and is it treatable?**	It is a common concern where ejaculation happens sooner than desired. Behavioural techniques and medicines work well for most men.
6	**How do kidney stones differ from gallstones?**	Kidney stones form in the urinary system and cause pain in the flank, while gallstones form in the gallbladder and cause upper abdominal pain. Imaging confirms which one is the cause.

Set 6

No.	Question	Answer
1	**What is hydronephrosis?**	It is swelling of the kidney from urine that cannot drain properly, often from a blockage. Finding and clearing the cause protects kidney function.
2	**Why do children wet the bed after age 5?**	It is usually due to a slow developing bladder control and deep sleep, not a fault of the child. Simple routines and, when needed, medicines or alarms can help.
3	**What is a urine culture test?**	It grows germs from a urine sample to find which bacteria cause an infection and which antibiotics work against them. It helps treat infections accurately.
4	**Can stress or anxiety affect the bladder?**	Yes, anxiety can cause a frequent need to pass urine. Relaxation, bladder training and treating the stress can ease the symptoms.
5	**What lifestyle habits help prevent kidney stones?**	Drink plenty of water, limit salt and balance animal protein intake. Those who form stones often may need a urine analysis for tailored advice.
6	**What is a cystoscopy?**	It is a quick look inside the bladder using a thin camera. It helps diagnose bleeding, stones and growths accurately.

15. Psychiatry

Set 1

No.	Question	Answer
1	**What are the signs of depression?**	Persistent sadness, loss of interest, sleep and appetite change and low energy lasting over 2 weeks are signs. Depression is a treatable medical condition.
2	**How is anxiety different from normal worry?**	Anxiety is excessive and hard to control, and it interferes with daily life, sleep and relationships. Therapy and medicines are both effective.
3	**Is therapy or medicine better for mental health conditions?**	It depends on the condition and severity. Many people benefit from a combination, and a specialist can guide the right plan.
4	**How can I help someone who seems to be struggling mentally?**	Listen without judgement, avoid dismissing their feelings and encourage them to seek professional help. Take talk of self harm seriously and seek help at once.
5	**Can stress cause physical symptoms?**	Yes. Stress can cause headaches, acidity, palpitations, poor sleep and body aches. Managing stress often eases these symptoms.
6	**How can I improve sleep without relying on pills?**	Keep fixed sleep timings, avoid screens before bed, limit caffeine and exercise daily. Persistent insomnia should be assessed.

Set 2

No.	Question	Answer
1	**What is a panic attack and how is it different from a heart attack?**	A panic attack is a sudden wave of fear with racing heart, breathlessness and sweating that peaks within minutes. Because symptoms can overlap, a first episode should be checked, and panic is very treatable.
2	**What is obsessive compulsive disorder?**	OCD involves unwanted repeated thoughts and rituals that are hard to resist. Therapy and medicines can reduce them significantly.
3	**What is bipolar disorder?**	It causes episodes of very high energy and low mood that differ from normal ups and downs. Mood stabilising treatment helps people lead steady, productive lives.
4	**Can children and teenagers have depression or anxiety?**	Yes, and it can show as irritability, falling grades or withdrawal rather than sadness. Early support makes a big difference.
5	**What are the effects of too much screen time on mental health?**	Heavy use can disturb sleep, attention and mood, especially in young people. Fixed screen free times and outdoor activity help restore balance.
6	**Is it true that mental illness is a sign of weakness?**	No, mental health conditions are medical conditions involving brain chemistry, genes and life stress. Seeking treatment is a sign of strength.

Set 3

No.	Question	Answer

No.	Question	Answer
1	**What is schizophrenia and can people recover?**	It is a condition that affects thinking, perception and behaviour, sometimes with hearing voices. With regular treatment and family support, many people live fulfilling lives.
2	**How do I know if my drinking or substance use is a problem?**	Craving, failed attempts to cut down and harm to work or relationships are warning signs. Treatment and counselling can help recovery at any stage.
3	**What is postpartum depression?**	It is lasting sadness, anxiety or exhaustion after childbirth that goes beyond usual baby blues. It is common and responds well to treatment and support.
4	**What is ADHD in children?**	It involves persistent inattention, restlessness and impulsive behaviour beyond what is typical for age. Behaviour strategies and, when needed, medicines help children thrive.
5	**How does grief differ from depression?**	Grief comes in waves tied to loss and usually eases with time, while depression is constant low mood that affects self worth. Support is helpful in both.
6	**What is social anxiety?**	It is intense fear of being judged in social situations, leading to avoidance. Gradual exposure therapy and medicines can build confidence.

Set 4

No.	Question	Answer
1	**Why do I feel low and tired every winter or monsoon?**	Seasonal depression can follow changes in daylight and routine. Morning sunlight, activity and professional support can lift mood.
2	**What are the early signs of dementia?**	Forgetting recent events, repeating questions and trouble with familiar tasks are early signs. Evaluation can find treatable causes and help plan care.
3	**What is cognitive behavioural therapy?**	CBT is a structured talking therapy that helps change unhelpful thought patterns and behaviours. It is effective for anxiety, depression and many other conditions.
4	**What is burnout and how can I recover from it?**	Burnout is deep exhaustion and detachment from long term work stress. Rest, boundaries, support and sometimes professional care help recovery.
5	**How can parents support a child facing exam pressure?**	Encourage routines, sleep, breaks and realistic goals, and avoid comparisons. Persistent fear or physical complaints need professional guidance.
6	**Are psychiatric medicines addictive?**	Most medicines used for depression and anxiety are not habit forming when taken as prescribed. Never stop them suddenly without guidance.

Set 5

No.	Question	Answer

No.	Question	Answer
1	**What is post traumatic stress disorder?**	PTSD can follow a frightening event and cause flashbacks, nightmares and constant alertness. Trauma focused therapy can bring real relief.
2	**How is insomnia linked to mental health?**	Poor sleep can both cause and result from anxiety and depression. Treating sleep and mood together gives the best results.
3	**What is an eating disorder?**	It involves unhealthy patterns of eating and intense concern about weight or shape, such as anorexia or bulimia. Early treatment improves recovery greatly.
4	**Why do older adults feel lonely and low?**	Retirement, loss of loved ones and health issues can affect mood. Social connection, activity and treatment of depression improve wellbeing.
5	**What is a mental health emergency?**	Thoughts of self harm, severe confusion, or violent behaviour need urgent help. Reach a nearby emergency service or helpline without delay.
6	**Can yoga and meditation help mental health?**	They can reduce stress and improve sleep and mood as a helpful addition to care. They work best alongside treatment for moderate to severe conditions.

Set 6

No.	Question	Answer
1	**What is generalised anxiety disorder?**	It is constant worry about many everyday matters with restlessness and poor sleep. It is treatable with therapy and, if needed, medicines.
2	**How can I tell if a teenager is using drugs?**	Sudden mood swings, secrecy, falling grades and changed friends can be signs. Calm, open conversation and early professional help work better than punishment.
3	**What is body dysmorphic disorder?**	It is an intense preoccupation with a perceived flaw in appearance that others do not notice. Therapy can reduce distress and improve daily life.
4	**What is the role of family in treating mental illness?**	Family support improves treatment follow through and relapse prevention. Education about the condition makes caring easier.
5	**Why does stress make people irritable and angry?**	Stress hormones keep the body on high alert, reducing patience. Exercise, breaks and talking things through lower the tension.
6	**What are the signs of gaming or internet addiction?**	Losing control over time, neglecting study or work and irritability when offline are common signs. Structured limits and counselling help restore balance.

16. Oncology

Set 1

No.	Question	Answer
1	**What are the early warning signs of cancer?**	Unexplained weight loss, a lump, persistent cough, blood in stool or urine, and non healing sores are warning signs. Early detection greatly improves outcomes.
2	**Which cancer screenings should adults consider?**	Breast, cervical, colon, oral and prostate screenings are advised at different ages. Your risk factors and family history guide the schedule.
3	**Does a family history of cancer mean I will get it?**	It raises risk but does not guarantee cancer. Genetic counselling and earlier screening help those with a strong family history.
4	**What are the common treatments for cancer?**	Surgery, chemotherapy, radiation, targeted therapy and immunotherapy are used alone or together. The plan depends on cancer type and stage.
5	**How can I lower my cancer risk?**	Avoid tobacco and limit alcohol, eat plant rich foods, stay active and get vaccinated against HPV and hepatitis B.
6	**How can diet and lifestyle support recovery during treatment?**	Protein rich meals, hydration, gentle activity and rest support strength during treatment. A nutrition plan tailored to your treatment helps.

Set 2

No.	Question	Answer
1	**What is the difference between a benign and a malignant tumour?**	A benign tumour does not spread and is usually less dangerous, while a malignant one can invade other parts of the body. A biopsy tells them apart.
2	**Why is a breast lump not always cancer?**	Many lumps are cysts or fibroadenomas, which are harmless. Any new lump should still be checked so that cancer is not missed.
3	**What are the symptoms of oral cancer?**	A mouth ulcer that does not heal in 2 weeks, white or red patches and difficulty swallowing are warning signs. Tobacco and betel quid are major risk factors, so quitting helps greatly.
4	**What is a Pap smear and who needs it?**	It is a quick test that finds early changes in the cervix before cancer develops. Regular screening for women prevents cervical cancer.
5	**What is a biopsy and why is it done?**	A small tissue sample is examined under a microscope to confirm whether a growth is cancer. It guides the most accurate treatment plan.
6	**Can cancer be cured?**	Many cancers can be cured, especially when found early. Even advanced cancers can often be controlled for years with modern treatment.

Set 3

No.	Question	Answer

No.	Question	Answer
1	**What is the HPV vaccine and who should take it?**	It protects against the virus that causes most cervical cancers. It is most effective when taken in girls and boys before exposure, ideally at ages 9 to 14.
2	**How does tobacco cause cancer?**	Tobacco contains many cancer causing chemicals that damage cells in the mouth, lungs and other organs. Quitting at any age lowers risk.
3	**What is a PET scan?**	It uses a small amount of tracer to show active cancer cells in the body. It helps with diagnosis, staging and checking response to treatment.
4	**What are the signs of lung cancer?**	A cough lasting more than 3 weeks, blood in sputum, chest pain and unexplained weight loss need evaluation. Many symptoms also come from other conditions, so a chest scan helps clarify.
5	**How is breast cancer treated?**	Treatment may combine surgery, radiation, hormone therapy, chemotherapy and targeted medicines. Early stage breast cancer has excellent outcomes.
6	**What is a mammogram?**	It is a low dose breast X ray that can find tiny changes long before a lump can be felt. Regular screening from the age advised by your specialist saves lives.

Set 4

No.	Question	Answer
1	**What is chemotherapy and what side effects can occur?**	Chemotherapy uses medicines to destroy fast growing cancer cells. Nausea, hair loss and tiredness can occur, and supportive medicines reduce them.
2	**What is immunotherapy?**	It helps the body's own immune system recognise and attack cancer cells. It has brought new hope in several types of cancer.
3	**What are the warning signs of colon cancer?**	Blood in stool, long lasting change in bowel habits, belly pain and unexplained tiredness can be signs. Screening after age 45 or 50 helps catch it early.
4	**What is radiation therapy?**	It uses focused high energy rays to destroy cancer cells while sparing healthy tissue as much as possible. Each session is painless and brief.
5	**What is the difference between leukaemia and lymphoma?**	Leukaemia begins in the blood and bone marrow, while lymphoma begins in the lymph nodes and immune system. Both are treatable and many patients do well.
6	**Why do cancer patients feel so tired?**	Cancer itself, treatment and anaemia can drain energy. Light activity, good nutrition and treating the cause can help.

Set 5

No.	Question	Answer

No.	Question	Answer
1	**What are cancer stages?**	Staging describes how big the cancer is and whether it has spread. It helps predict outcomes and choose the right treatment.
2	**Is cancer contagious?**	No, cancer cannot spread from one person to another through touch or sharing food. You can safely care for and be close to someone with cancer.
3	**What are the early symptoms of cervical cancer?**	Unusual bleeding between periods or after intimacy and persistent discharge can be early signs. Screening can detect changes even before symptoms start.
4	**What is palliative care?**	It focuses on relief from pain and other symptoms and improves comfort at any stage of cancer. It works alongside treatment and is not only for the end of life.
5	**What are tumour markers?**	They are substances in blood that can rise with certain cancers. They help monitor treatment but are not used alone to diagnose cancer.
6	**What are the risk factors for liver cancer?**	Hepatitis B and C, heavy alcohol use and fatty liver disease raise risk. Vaccination, early treatment of hepatitis and a healthy lifestyle lower it.

Set 6

No.	Question	Answer
1	**What is targeted therapy?**	These medicines act on specific features of cancer cells, often with fewer effects on healthy cells. Tests on the tumour show who may benefit.
2	**What does it mean when cancer is in remission?**	Remission means signs of cancer have reduced or disappeared after treatment. Regular follow up checks confirm that it stays away.
3	**Can stress cause cancer?**	There is no proof that stress alone causes cancer. Managing stress, however, helps people cope better and make healthy choices.
4	**Who should consider genetic testing for cancer?**	People with several close relatives with breast, ovarian, colon or other cancers at a young age may benefit. Results can guide screening and prevention.
5	**What are the symptoms of prostate cancer?**	Early disease often has no symptoms, while later signs include weak urine flow and bone pain. Screening conversations from midlife help find it sooner.
6	**How does a bone marrow transplant help?**	It replaces diseased marrow with healthy stem cells in certain blood cancers. It can offer a chance of long term cure.

17. Dentistry

Set 1

No.	Question	Answer
1	**How often should I visit a dentist?**	A check up and cleaning every 6 months helps catch cavities and gum disease early. Those with gum problems may need more frequent visits.
2	**What causes tooth cavities and how can they be prevented?**	Sugar, plaque and poor brushing allow bacteria to damage enamel. Brush twice daily with fluoride toothpaste, floss and limit sweets.
3	**What is a root canal and is it painful?**	A root canal removes infected pulp from a tooth to save it. With modern anaesthesia it is comfortable and relieves the pain caused by infection.
4	**Why do my gums bleed when I brush?**	Bleeding usually signals gum inflammation from plaque buildup. Better cleaning and a professional scaling usually fix it, but persistent bleeding needs a check.
5	**What are the options for replacing missing teeth?**	Dental implants, bridges and dentures are common options. The right choice depends on bone health, number of missing teeth and budget.
6	**How can braces or aligners correct crooked teeth?**	Both gently move teeth into position over months. Treatment length and choice depend on how complex the alignment issue is.

Set 2

No.	Question	Answer
1	**What causes bad breath and how can it be treated?**	Bacteria on the tongue, gum disease and cavities are the most common causes. Cleaning teeth and tongue daily and treating the cause freshens breath.
2	**What is tooth sensitivity?**	It is a sharp, short pain from hot, cold or sweet foods when enamel wears or gums recede. Desensitising toothpaste and treating the cause bring relief.
3	**How do wisdom teeth cause problems?**	They can be impacted, painful and trap food, leading to infection. Removal is advised only when they cause trouble.
4	**What is gum disease and why does it matter?**	It is infection of the tissues around teeth caused by plaque. Treated early it is reversible, and untreated it can loosen teeth.
5	**How does smoking or chewing tobacco affect teeth?**	It stains teeth, harms gums and greatly raises the risk of oral cancer. Quitting benefits your mouth quickly.
6	**What are dental sealants for children?**	They are thin protective coatings placed on the chewing surfaces of back teeth. They help block decay in cavity prone grooves.

Set 3

No.	Question	Answer

No.	Question	Answer
1	**Why do baby teeth matter even though they fall out?**	They help with chewing, speech and guiding permanent teeth into place. Decay in baby teeth can cause pain and affect adult teeth.
2	**What is teeth whitening and is it safe?**	It lightens stains using professional peroxide based products. It is safe when properly supervised, though some temporary sensitivity may occur.
3	**What should I do if a tooth gets knocked out?**	Hold it by the crown, rinse gently without scrubbing and place it back or keep it in milk. Reaching dental care within an hour gives the best chance of saving it.
4	**What is a dental crown?**	It is a cap placed over a weak or damaged tooth to restore its strength and shape. It protects the tooth and helps it last for years.
5	**Can mouth ulcers be a sign of something serious?**	Most heal within 1 to 2 weeks and are harmless. An ulcer lasting more than 2 weeks should be checked to rule out serious conditions.
6	**What is the right way to brush teeth?**	Use a soft brush with gentle circular motions for 2 minutes, twice daily, with fluoride toothpaste. Replace the brush every 3 months.

Set 4

No.	Question	Answer
1	**What is teeth grinding and why does it happen?**	Bruxism is clenching or grinding teeth, often during sleep and linked to stress. A night guard protects teeth and eases jaw pain.
2	**How do dental implants work?**	A small titanium post is placed in the jaw to hold a replacement tooth that looks and works like a natural one. With good care, implants can last for many years.
3	**Is mouthwash necessary every day?**	Brushing and flossing are the essentials, and mouthwash is an optional extra. Choose an alcohol free option and use it as advised.
4	**What causes yellow teeth?**	Tea, coffee, tobacco, ageing and some medicines can darken teeth. Cleaning and whitening can improve shade in most cases.
5	**What is a dental abscess?**	It is a pocket of pus from tooth or gum infection causing throbbing pain and swelling. It needs prompt treatment, as infection can spread.
6	**Why do I get jaw pain or clicking when opening my mouth?**	Problems with the jaw joint, called TMJ disorders, are a common cause. Rest, gentle exercises and bite correction can relieve them.

Set 5

No.	Question	Answer

No.	Question	Answer
1	**What are tooth coloured fillings?**	They are composite materials that match your natural tooth shade and bond to it. They restore teeth neatly with minimal drilling.
2	**How does diabetes affect oral health?**	High sugar raises the risk of gum disease and dry mouth, and gum infection can in turn make sugar harder to control. Good oral care supports both.
3	**What is a dental scaling and polishing?**	It removes plaque and tartar from teeth and gum lines and smooths the surface. It keeps gums healthy and teeth cleaner.
4	**Is it safe to have dental treatment during pregnancy?**	Routine care is safe, especially in the second trimester. Healthy gums also support a healthy pregnancy.
5	**What are braces retainers for?**	Retainers hold teeth in their new position after braces. Wearing them as advised prevents teeth from shifting back.
6	**How can I care for dentures?**	Clean them daily, soak them overnight and handle them gently. Check fit regularly, since gums change shape over time.

Set 6

No.	Question	Answer
1	**What is dry mouth and why is it harmful?**	Low saliva raises the risk of cavities, infection and bad breath. Sipping water, sugar free gum and treating the cause help.
2	**Why do cavities hurt only sometimes?**	Early cavities may be painless, and pain appears when decay nears the nerve. Early treatment is simpler and saves the tooth.
3	**What is oral thrush?**	It is a fungal infection with white patches in the mouth, common with inhaler or denture use. Antifungal treatment and good hygiene clear it.
4	**What is a tooth extraction aftercare routine?**	Bite on gauze, avoid spitting and straws, and eat soft cool foods for a day or two. This protects the blood clot and speeds healing.
5	**Is chewing neem sticks as good as brushing?**	Neem twigs can help clean teeth but do not replace fluoride toothpaste and flossing. Combining good tools is the best way to prevent decay.
6	**How does thumb sucking affect a child's teeth?**	Prolonged habits after age 4 or 5 can push teeth forward and change the bite. Gentle encouragement and a dental review can help stop it.

18. Critical Care

Set 1

No.	Question	Answer
1	**What conditions are treated in an intensive care unit?**	Severe infections, respiratory failure, heart emergencies, major trauma and organ failure are managed in the ICU. It offers continuous monitoring and life support.
2	**What is sepsis and why is it an emergency?**	Sepsis is the body's extreme reaction to infection that can damage organs. Fever, fast heartbeat, confusion and low blood pressure need immediate hospital care.
3	**What does a ventilator do?**	A ventilator supports or takes over breathing when the lungs cannot manage on their own. It is a temporary support while the underlying illness is treated.
4	**What are the signs that a patient needs urgent critical care?**	Severe breathlessness, chest pain, confusion, unresponsiveness, uncontrolled bleeding or very low blood pressure need an emergency response.
5	**How can families support a loved one in the ICU?**	Stay in touch with the care team, follow visiting guidelines and ask for regular updates. Calm, familiar voices often help recovery.
6	**What is the recovery like after a critical illness?**	Many patients feel weak or tired for weeks and benefit from rehabilitation, nutrition and follow up care. Recovery timelines vary widely.

Set 2

No.	Question	Answer
1	**What is septic shock and how is it different from sepsis?**	Septic shock is the most severe form of sepsis, where blood pressure stays dangerously low despite fluids. Fast antibiotics, fluids and medicines to support blood pressure greatly improve survival.
2	**What is ARDS?**	Acute respiratory distress syndrome is sudden, severe lung inflammation that stops oxygen from reaching the blood. Treatment with ventilator support, careful fluids and treating the cause helps the lungs heal.
3	**What is a tracheostomy and when is it needed?**	It is a small opening in the neck that allows a breathing tube to be placed directly into the windpipe. It is used when a patient needs a ventilator for a longer time, as it is more comfortable and makes weaning easier.
4	**What is delirium in the ICU?**	Delirium is sudden confusion, agitation or drowsiness that can occur during critical illness. It is often temporary and can be reduced by good sleep, daylight, family presence and early mobilisation.
5	**How is dengue shock recognised and treated?**	Warning signs include severe stomach pain, repeated vomiting, bleeding and cold clammy skin after the fever settles. Close monitoring and timely fluid management in a critical care unit can be life saving.
6	**What is a central line and why is it used?**	A central line is a thin tube placed in a large vein to give strong medicines, fluids and nutrition safely. It also allows accurate monitoring of the heart and circulation.

Set 3

No.	Question	Answer
1	**What causes acute kidney injury in critically ill patients?**	Low blood pressure, severe infection, dehydration and some medicines can suddenly reduce kidney function. Early correction of the cause often allows the kidneys to recover, and dialysis can support them meanwhile.
2	**What is organophosphate poisoning and why is it an emergency?**	It is poisoning from certain pesticides, which is a common farm related emergency in India. Quick antidote treatment and breathing support can save life when started early.
3	**What is non invasive ventilation?**	It delivers breathing support through a tight fitting mask without placing a tube in the windpipe. It can help patients with COPD flare ups or fluid in the lungs avoid a full ventilator.
4	**What is a snakebite emergency and what should be done?**	Keep the person calm and still, immobilise the limb and reach a hospital with antivenom at once. Cutting, sucking or tying tightly does not help and can cause harm.
5	**Why is blood sugar monitored closely in the ICU?**	Both very high and very low sugar levels can worsen recovery from serious illness. Keeping levels in a safe range lowers infection risk and helps healing.
6	**What is ICU acquired weakness?**	It is muscle weakness that can develop after a long stay in intensive care. Early movement and physiotherapy during the stay reduce its effect and speed return to daily life.

Set 4

No.	Question	Answer
1	**What is multi organ failure?**	It means two or more organs, such as the lungs, kidneys or liver, stop working properly at the same time, often after severe infection or injury. Supporting each organ while treating the cause gives the body time to recover.
2	**How does a patient get nutrition in the ICU?**	Feeding is usually given through a thin tube into the stomach or through a vein, starting early where possible. Good nutrition protects muscles and strengthens the body against infection.
3	**What is cardiac arrest and how is it different from a heart attack?**	A heart attack is a blocked artery, while cardiac arrest is when the heart suddenly stops pumping effectively. Immediate CPR and a defibrillator shock greatly raise the chance of survival.
4	**How is severe malaria treated in critical care?**	Severe malaria can affect the brain, kidneys and lungs and needs intravenous antimalarial medicine with organ support. Early treatment prevents complications and improves recovery.
5	**What are the risks of infection in the ICU and how are they prevented?**	Lines, tubes and a weakened body can raise infection risk. Hand hygiene, clean line care and removing tubes as soon as they are not needed keep patients safer.
6	**What is a stroke emergency and why is time important?**	A stroke is a sudden loss of blood flow or bleeding in the brain, causing face drooping, arm weakness or slurred speech. Treatment within the first few hours can save brain tissue and reduce disability.

Set 5

No.	Question	Answer
1	**What does the term GCS mean?**	The Glasgow Coma Scale scores eye opening, speech and movement to show how alert a patient is. It helps the care team track changes in the brain and respond quickly.
2	**What is acute pancreatitis and when does it need intensive care?**	It is sudden inflammation of the pancreas causing severe upper abdominal pain, often from gallstones or alcohol. Severe cases can affect the lungs and kidneys and benefit from close monitoring.
3	**What is heat stroke and how is it treated?**	Heat stroke is a dangerously high body temperature with confusion, which is a real risk during Indian summers. Rapid cooling, fluids and emergency care prevent organ damage.
4	**Why do some patients need vasopressor medicines?**	These medicines tighten blood vessels to raise very low blood pressure during shock. They keep blood flowing to the brain, heart and kidneys while the cause is treated.
5	**What is respiratory failure?**	It means the lungs cannot supply enough oxygen or remove enough carbon dioxide. Oxygen therapy or ventilator support, along with treating the cause, helps restore normal breathing.
6	**How can I help prevent hospital acquired pressure sores in a bedbound person?**	Changing position every two hours, keeping skin clean and dry and using a pressure relieving mattress protect the skin. Early care stops small red patches from turning into deep wounds.

Set 6

No.	Question	Answer
1	**What is diabetic ketoacidosis?**	It is a serious complication of diabetes where the body builds up acids, causing thirst, vomiting, fast breathing and drowsiness. Insulin, fluids and electrolyte correction in a monitored setting reverse it safely.
2	**What is ECMO?**	ECMO is a machine that takes over the work of the heart or lungs for a short time by oxygenating blood outside the body. It gives severely ill patients time to recover when other support is not enough.
3	**How are severe head injuries managed in the ICU?**	Care focuses on keeping the brain well supplied with oxygen, controlling pressure inside the skull and preventing further injury. Early scans and monitoring help guide timely treatment.
4	**What is severe pneumonia and when is it life threatening?**	It is a lung infection causing breathlessness, low oxygen and confusion, especially in older adults and those with other illnesses. Early antibiotics and oxygen support improve outcomes.
5	**Why are sedation breaks done in ICU patients on ventilators?**	Daily lightening of sedation lets the team check how awake the patient is and whether they can breathe more on their own. It shortens ventilator time and ICU stay.
6	**What are advance care wishes and why talk about them?**	They are a person's preferences about the level of treatment they would want in serious illness. Sharing them with family helps loved ones make confident, caring decisions.

19. Rheumatology

Set 1

No.	Question	Answer
1	**What are the early signs of rheumatoid arthritis?**	Morning stiffness lasting over 30 minutes, swollen small joints of the hands and fatigue are early signs. Early treatment prevents joint damage.
2	**What is lupus and who is at risk?**	Lupus is an immune condition that can affect skin, joints and organs. It is more common in women of childbearing age and is managed with long term treatment.
3	**What is gout and how can it be controlled?**	Gout causes sudden, painful joint swelling from high uric acid, often in the big toe. Medicines, hydration and limiting red meat and alcohol help prevent attacks.
4	**What is ankylosing spondylitis?**	It is an inflammatory condition causing chronic back pain and stiffness that improves with movement. Exercise and medicines prevent spine stiffening.
5	**How is fibromyalgia different from arthritis?**	Fibromyalgia causes widespread pain and fatigue without joint damage. Management combines exercise, sleep care and symptom relief.
6	**Which blood tests help diagnose autoimmune conditions?**	RA factor, anti CCP, ANA, ESR and CRP are common tests. Results are read together with symptoms and examination.

Set 2

No.	Question	Answer
1	**What causes joint pain and swelling that lasts more than six weeks?**	Persistent swelling can point to inflammatory arthritis such as rheumatoid arthritis rather than simple wear and tear. Early assessment and treatment protect the joints from permanent damage.
2	**What is psoriatic arthritis?**	It is joint inflammation that can occur in people with psoriasis, sometimes before skin changes are obvious. Modern treatment controls pain, stiffness and skin symptoms together.
3	**What is osteoarthritis and how is it managed?**	It is wear of joint cartilage, common in the knees and hips with age. Weight control, strengthening exercise, pain relief and joint protection keep people active.
4	**What is Sjogren syndrome?**	It is an autoimmune condition causing persistent dry eyes and dry mouth. Lubricating drops, good dental care and treatment of related symptoms improve comfort.
5	**Does diet affect gout?**	Limiting red meat, organ meats, alcohol and sugary drinks can lower uric acid levels. A balanced diet with plenty of water and regular medicine use helps prevent attacks.
6	**What is vasculitis?**	Vasculitis is inflammation of blood vessels that can cause fever, rashes, numbness or organ problems. Early diagnosis and treatment prevent lasting damage.

Set 3

No.	Question	Answer

No.	Question	Answer
1	**Why are my joints stiff in the morning?**	Stiffness lasting more than 30 minutes after waking often suggests inflammatory arthritis, while short stiffness is more typical of wear and tear. Noting how long it lasts helps point to the cause.
2	**What is scleroderma?**	It is an autoimmune condition causing thickening and tightening of the skin and sometimes internal organs. Early treatment and regular monitoring help protect the lungs, gut and circulation.
3	**Can children get arthritis?**	Yes, juvenile idiopathic arthritis can cause joint swelling, limping and stiffness in children. Early treatment helps children grow, play and attend school normally.
4	**What is Raynaud phenomenon?**	It is when fingers and toes turn white or blue in the cold because of narrowed small blood vessels. Keeping warm and checking for an underlying autoimmune condition protects the skin.
5	**Is it safe to exercise with arthritis?**	Yes, gentle regular exercise reduces pain, builds muscle support and keeps joints flexible. Low impact options like walking, swimming and yoga are often well tolerated.
6	**What is reactive arthritis?**	It is joint swelling that follows an infection in the gut or urinary tract, often in the knees or ankles. It usually settles with treatment and many people recover fully.

Set 4

No.	Question	Answer
1	**What is the difference between uric acid and gout?**	Uric acid is a waste product in blood, and gout is the painful joint attack that happens when crystals form from high levels. Some people have high uric acid without ever having an attack.
2	**What is polymyalgia rheumatica?**	It causes pain and stiffness in the shoulders and hips in people over 50, usually worse in the morning. It responds well to treatment, often giving quick relief.
3	**What are DMARDs?**	Disease modifying antirheumatic drugs calm the immune system to slow joint damage in conditions like rheumatoid arthritis. Taken regularly with monitoring, they can keep the disease under control.
4	**Do vitamin D and calcium matter for bone and joint health?**	Yes, low vitamin D is very common in India and can weaken bones and worsen muscle aches. A simple blood test and sunlight, diet or supplements help restore levels.
5	**What is osteoporosis and who should be checked?**	It is thinning of bones that raises the risk of fractures, especially in women after menopause and people on long term steroids. A bone density scan finds it early so treatment can protect the bones.
6	**What is chikungunya arthritis?**	Joint pain after chikungunya fever can last for weeks or months, mostly in the hands, wrists and ankles. Pain relief, gentle movement and medical review help most people recover.

Set 5

No.	Question	Answer

No.	Question	Answer
1	**Can autoimmune diseases run in families?**	Genes can raise the risk, but most people with a relative are never affected. Awareness of early symptoms helps in getting timely care.
2	**What is back pain from inflammation and how is it different from muscle strain?**	Inflammatory back pain starts before age 40, is worse at rest or at night and improves with movement. Muscle strain usually worsens with activity and improves with rest.
3	**What is myositis?**	It is inflammation of the muscles causing weakness, often in the thighs and shoulders, which makes climbing stairs or lifting arms hard. Treatment can restore strength in many people.
4	**What does a high ESR or CRP mean?**	These blood tests show inflammation in the body but do not point to one condition. Doctors use them with symptoms and other tests to find the cause and track treatment.
5	**What is a swollen heel or Achilles pain from inflammation?**	Pain and swelling at the heel can come from inflammatory conditions that affect where tendons attach to bone. Proper assessment guides the right treatment and prevents long term pain.
6	**Why should steroids not be stopped suddenly?**	Long term steroids make the body depend on them, so stopping suddenly can cause weakness, low blood pressure and a flare of the disease. A gradual, supervised reduction is safe.

Set 6

No.	Question	Answer
1	**What is pseudogout?**	It is a joint attack caused by calcium crystals, mostly in the knees of older adults, and looks similar to gout. Testing joint fluid tells the two apart so the right treatment is given.
2	**What is Behcet disease?**	It is a condition causing repeated mouth ulcers, genital sores and eye inflammation. Early treatment protects vision and reduces flare ups.
3	**Is arthritis only a disease of old age?**	No, many types start in young adults and even children. Early symptoms deserve attention at any age.
4	**How can I protect my joints at work and home?**	Use proper posture, take movement breaks, avoid long periods of squatting or heavy lifting and use supportive tools. Small changes reduce daily joint strain.
5	**What are biologic medicines for arthritis?**	Biologics are targeted treatments that block specific parts of the immune system causing inflammation. They can bring relief when other medicines are not enough.
6	**Do cracking joints mean arthritis?**	Painless cracking is common and usually harmless. It only needs attention if it comes with pain, swelling or locking.

20. General Surgery

Set 1

No.	Question	Answer
1	**What are the symptoms of appendicitis?**	Pain starting near the navel and shifting to the lower right abdomen, with fever, nausea and loss of appetite. It needs urgent evaluation, as delay can cause rupture.
2	**What is a hernia and does it always need surgery?**	A hernia is a bulge where tissue pushes through a weak spot in the muscle wall. Most hernias do not heal on their own, and surgery is the definitive repair.
3	**How are gallstones treated?**	Gallstones causing pain or infection are treated by removing the gallbladder, usually through keyhole surgery. Recovery is quick and life continues normally.
4	**What is piles and how can it be treated?**	Piles are swollen veins in the anal region causing bleeding or discomfort. Fibre, water and medicines help early cases, while advanced ones may need a procedure.
5	**What is laparoscopic surgery and what are its benefits?**	It uses small cuts and a camera, leading to less pain, smaller scars and faster recovery than open surgery.
6	**How should I prepare for and recover from surgery?**	Follow fasting and medicine instructions, stop smoking and plan rest at home. Gentle walking and wound care speed recovery.

Set 2

No.	Question	Answer
1	**What is a thyroid nodule and does it always need surgery?**	Most thyroid lumps are harmless, and a simple ultrasound and needle test show which ones need attention. Surgery is advised only for nodules that are suspicious, large or causing symptoms.
2	**What are the signs of a bowel obstruction?**	Cramping belly pain, repeated vomiting, a swollen belly and not passing gas or stools are warning signs. It needs urgent care to prevent damage to the bowel.
3	**What is an anal fissure and how is it treated?**	It is a small tear in the anal lining causing sharp pain and bright red blood after passing stool. Fibre, water, warm baths and prescribed ointments heal most fissures.
4	**What is a breast lump and when should it be checked?**	Many breast lumps are harmless, but any new lump, nipple discharge or skin change should be examined. Early checks with examination, ultrasound or mammography catch problems early.
5	**What are varicose veins and how are they treated?**	They are swollen, twisted veins in the legs from weak valves, causing heaviness and aching. Compression stockings, walking and modern minimally invasive procedures relieve symptoms.
6	**What is a pilonidal sinus?**	It is a painful infected pocket of skin near the tailbone, common in young adults. Drainage or minor surgery and good hygiene prevent repeated flare ups.

Set 3

No.	Question	Answer

No.	Question	Answer
1	**What is an abdominal wall hernia after surgery?**	An incisional hernia is a bulge at an old surgical scar where the muscle layer has weakened. Repair with or without mesh strengthens the area and prevents complications.
2	**What causes a stomach ulcer and how is it treated?**	Common causes are H. pylori infection and long use of painkillers. Treatment with acid reducing medicines and antibiotics heals most ulcers.
3	**What is a perianal abscess and fistula?**	An abscess is a painful collection of pus near the anus, which may leave a channel called a fistula. Timely drainage and appropriate surgery give lasting relief.
4	**What is a goitre and why is it common in some regions?**	It is swelling of the thyroid gland, often related to iodine deficiency or thyroid disease. Iodised salt prevents many cases, and treatment depends on the cause.
5	**What is acute cholecystitis?**	It is inflammation of the gallbladder, usually from a gallstone, causing pain on the upper right side with fever. Early treatment and keyhole removal of the gallbladder lead to quick recovery.
6	**How can I reduce the risk of colorectal cancer?**	A high fibre diet, regular exercise, avoiding tobacco and alcohol and screening after age 45 to 50 lower the risk. Finding and removing polyps early can prevent cancer.

Set 4

No.	Question	Answer
1	**What is a lipoma?**	A lipoma is a soft, painless lump of fat under the skin that grows slowly and is harmless. It can be removed if it is large, painful or bothers you cosmetically.
2	**What is diverticulitis?**	It is inflammation of small pouches in the large bowel wall, causing lower left belly pain and fever. Rest, diet changes and antibiotics help most cases, and fibre reduces recurrence.
3	**What is bariatric surgery and who is it for?**	It is weight loss surgery for people with severe obesity or obesity with diabetes who have not benefited from other methods. It can improve blood sugar, blood pressure and mobility.
4	**Why does acidity or reflux sometimes need surgery?**	Most reflux improves with lifestyle changes and medicines, but severe or persistent cases may need a keyhole procedure. It can reduce reliance on long term tablets.
5	**What is a hydrocele?**	It is a painless swelling of the scrotum caused by fluid around the testicle. Small ones can be watched, and larger ones are treated with a short surgery.
6	**What is an ingrown toenail and how is it treated?**	It occurs when the nail edge grows into the skin, causing pain and swelling. Soaking, proper nail cutting and, when needed, a minor procedure give lasting relief.

Set 5

No.	Question	Answer

No.	Question	Answer
1	**What are the warning signs of stomach or food pipe cancer?**	Difficulty swallowing, ongoing indigestion, unexplained weight loss and vomiting blood need prompt checks. Endoscopy can find problems early when treatment works best.
2	**What is a splenic or liver injury after an accident?**	Blunt belly injuries can damage internal organs and cause bleeding with pain and dizziness. Quick imaging and care at a hospital can prevent serious blood loss.
3	**What is rectal bleeding and when is it worrying?**	Bright red blood may come from piles, but persistent bleeding, changes in bowel habit or weight loss need proper testing. Colonoscopy helps find the exact cause.
4	**Is a day care surgery really safe?**	Many common operations like hernia repair and gallbladder removal can be done with the patient going home the same day. This is safe for suitable patients and means less hospital time and faster recovery.
5	**What is a cyst or swelling in the neck and when is it checked?**	Neck lumps can come from infected glands, thyroid or cysts and are usually harmless. A lump lasting more than two to three weeks should be examined.
6	**How can I prevent surgical wound infection?**	Keeping the wound clean and dry, taking prescribed medicines and following dressing advice lowers the risk. Redness, swelling, pus or fever should be reported early.

Set 6

No.	Question	Answer
1	**What is a pancreatic pseudocyst?**	It is a fluid collection that can form after pancreatitis, sometimes causing pain or fullness. Many settle on their own, and larger ones can be drained.
2	**What causes blood in vomit or black stools?**	These can signal bleeding from the stomach or upper gut, such as an ulcer. It is an emergency that needs urgent evaluation.
3	**Can a hernia be prevented?**	Avoiding heavy straining, treating constipation and chronic cough, keeping a healthy weight and using correct lifting technique lower the risk. Strong core muscles also help.
4	**What is a fatty liver and can it be reversed?**	It is fat build up in the liver, common in India with obesity and diabetes. Weight loss, exercise and reduced sugar and alcohol can reverse it in many people.
5	**What is a stoma and how do people live with it?**	A stoma is an opening on the belly that lets stool or urine leave the body into a bag after certain operations. With simple care and training people lead active, normal lives.
6	**What is the role of a biopsy before surgery?**	A biopsy takes a tiny sample of tissue to find exactly what a lump or growth is. It guides the safest and most effective treatment plan.

21. Physiotherapy

Set 1

No.	Question	Answer
1	**When should I see a physiotherapist for pain?**	Pain lasting more than a few days, after an injury, or limiting movement benefits from assessment. Early therapy often prevents a longer recovery.
2	**How can physiotherapy help with back and neck pain?**	Targeted exercises, posture correction and manual techniques ease pain and strengthen supporting muscles. Daily habits like desk setup matter too.
3	**Can physiotherapy help after a stroke?**	Yes. Guided exercises retrain movement, balance and strength. Starting early and staying regular gives the best recovery.
4	**What is the role of physiotherapy after joint replacement?**	It restores range of motion, strength and walking ability. Following the exercise plan closely speeds return to daily life.
5	**How can I recover from a sports injury safely?**	Rest, graded strengthening and a gradual return to play reduce re injury. Avoid rushing back before full strength returns.
6	**What exercises help improve posture and prevent aches?**	Stretching, core strengthening and regular movement breaks during desk work help. A physiotherapist can tailor them to your needs.

Set 2

No.	Question	Answer
1	**What is frozen shoulder and how is it treated?**	It is pain and stiffness that make lifting or rotating the arm difficult, often lasting many months. Stretching, joint mobilisation and guided exercise restore movement.
2	**How can physiotherapy help knee osteoarthritis?**	Strengthening the thigh muscles, improving flexibility and learning joint friendly movement reduce pain and improve walking. It can delay the need for surgery.
3	**What is sciatica and what helps it?**	Sciatica is pain that travels from the lower back down the leg because of nerve irritation. Specific exercises, posture correction and activity pacing reduce pain and speed recovery.
4	**What is tennis elbow and how is it treated?**	It is pain on the outer elbow from overuse of the forearm tendons, not just from tennis. Load management, stretching and strengthening exercises help it heal.
5	**How does physiotherapy help with breathing problems?**	Breathing exercises, airway clearance techniques and gradual exercise build lung strength and reduce breathlessness. It helps people with asthma, COPD and after lung infections.
6	**How can physiotherapy help children with developmental delay or cerebral palsy?**	Early therapy builds muscle strength, balance and movement skills through play based exercises. Regular practice at home with family support improves independence.

Set 3

No.	Question	Answer

No.	Question	Answer
1	**What is plantar fasciitis?**	It causes sharp heel pain with the first steps in the morning from irritation of the tissue under the foot. Calf and foot stretches, supportive footwear and strengthening usually relieve it.
2	**How does physiotherapy help after a heart attack or heart surgery?**	Supervised cardiac rehabilitation gradually builds stamina and confidence with safe exercise. It lowers the risk of future heart problems.
3	**What is a slipped disc and can it heal without surgery?**	A slipped disc presses on a nerve and causes back or leg pain. Most people improve with guided exercise, posture advice and time, without surgery.
4	**What is vertigo and how can physiotherapy help?**	Vertigo is a spinning sensation often caused by crystals in the inner ear moving out of place. Simple repositioning manoeuvres can relieve it quickly in many people.
5	**How does physiotherapy help women during and after pregnancy?**	Gentle exercises ease back pain, strengthen pelvic floor muscles and prepare the body for delivery. After birth, it helps restore core strength and prevents leaking of urine.
6	**What is carpal tunnel syndrome?**	It causes tingling, numbness and weakness in the hand from pressure on a nerve at the wrist, common in desk workers. Splints, nerve glides and work adjustments help many people.

Set 4

No.	Question	Answer
1	**How can I manage pain from desk work and long hours on the phone?**	Adjust your screen to eye level, take short movement breaks every 30 to 45 minutes and do neck and shoulder stretches. These habits reduce tech neck and shoulder tension.
2	**What is a sprained ankle and how should it be treated?**	A sprain is a stretched or torn ligament, causing swelling and pain when you walk. Early movement, support and balance exercises speed recovery and prevent repeat sprains.
3	**How does physiotherapy help Parkinson disease?**	Exercises for balance, stride and flexibility improve movement and reduce the risk of falls. Regular practice helps people stay independent for longer.
4	**Can physiotherapy help with urinary leakage?**	Yes, pelvic floor exercises strengthen the muscles that control the bladder. Many women and men notice a clear improvement within weeks.
5	**What is a stiff neck on waking and how can it be eased?**	It often comes from muscle spasm due to awkward sleeping posture. Gentle stretching, heat and a supportive pillow usually settle it within days.
6	**How does physiotherapy help older adults avoid falls?**	Balance, strength and walking exercises make everyday movement steadier and safer. Home safety advice further lowers the risk of falls.

Set 5

No.	Question	Answer

No.	Question	Answer
1	**What is a fracture rehabilitation programme?**	After a bone has healed, exercises restore joint movement, muscle strength and normal walking or arm use. Following the plan prevents lasting stiffness.
2	**Does physiotherapy help after a spinal cord injury?**	Yes, it builds strength, trains remaining movement and teaches safe transfers and mobility aids. Therapy helps maximise independence and prevents complications such as stiffness and pressure sores.
3	**What is Bell palsy and how is it managed?**	It is sudden weakness of one side of the face, often improving over weeks. Facial exercises, massage and eye care support recovery.
4	**What is the difference between heat and cold therapy for pain?**	Cold helps with fresh injuries and swelling, while heat relaxes tight muscles and stiff joints. Using the right one at the right time gives better relief.
5	**How can diabetic people benefit from physiotherapy?**	Regular exercise improves blood sugar control and circulation, while foot and balance training reduces nerve related problems. A plan tailored to your fitness keeps it safe.
6	**What is a muscle cramp or spasm and how can I prevent it?**	A cramp is a sudden tightening of a muscle, often from fatigue, dehydration or tight muscles. Stretching, hydration and gradual training reduce how often it happens.

Set 6

No.	Question	Answer
1	**What is scoliosis and can exercises help?**	Scoliosis is a sideways curve of the spine, often found in growing children. Specific exercises and bracing, when needed, help control progression and posture.
2	**How does physiotherapy help after a rotator cuff injury?**	Guided exercises restore shoulder movement and strengthen supporting muscles in stages. Many people regain full use without surgery.
3	**How does physiotherapy help with lymphoedema after cancer treatment?**	Special massage, compression and gentle exercise help drain swollen limbs. Early care reduces heaviness and the risk of infection.
4	**What is a safe way to start exercising after a long break?**	Begin with short, easy sessions, warm up properly and increase gradually by about 10% each week. This lowers the chance of injury and builds a lasting habit.
5	**What is TMJ pain and how is it treated?**	Jaw joint pain with clicking or difficulty chewing can come from stress, clenching or posture. Jaw exercises, relaxation and habit changes reduce discomfort.
6	**Can physiotherapy help with chronic fatigue or long Covid recovery?**	Yes, paced activity and breathing training rebuild stamina without overexertion. Gradual progress helps people return to daily routines.

22. Plastic and Cosmetic Surgery

Set 1

No.	Question	Answer
1	**What is reconstructive surgery and who needs it?**	It restores form and function after injury, burns, cancer surgery or birth differences. It is aimed at repair, not only appearance.
2	**How are burns scars treated?**	Pressure garments, silicone, laser and surgical revision can improve scars. Early care soon after a burn makes a major difference.
3	**What should I know before cosmetic surgery?**	Set realistic goals, understand risks and recovery time, and make sure you are medically fit. Never rush the decision.
4	**How are cleft lip and palate corrected?**	Staged surgeries in infancy and childhood repair the lip and palate. With speech therapy and follow up, most children do very well.
5	**What are the options for treating keloids and stretch marks?**	Steroid injections, silicone, laser and surgery help keloids. Stretch marks fade with creams, microneedling and laser, though not completely.
6	**How long is recovery after plastic surgery?**	It varies by procedure, from a few days to several weeks. Following wound care, rest and follow up instructions gives the best result.

Set 2

No.	Question	Answer
1	**What is a skin graft and when is it used?**	A skin graft moves healthy skin from one area to cover a wound, burn or surgical defect. It helps wounds heal faster and protects against infection.
2	**What is a rhinoplasty and what can it correct?**	Rhinoplasty reshapes the nose to improve its look, correct injury or improve breathing. A careful plan aims for a natural result in harmony with the face.
3	**What is a flap reconstruction?**	A flap moves tissue with its own blood supply to rebuild areas such as the breast, face or limbs. It gives stronger, better looking repair than a simple graft in many cases.
4	**How are hand injuries and deformities treated?**	Cuts to tendons, nerves and broken bones in the hand can often be repaired surgically, followed by hand therapy. Early repair gives the best chance of regaining grip and movement.
5	**What is breast reconstruction after cancer surgery?**	It rebuilds the breast shape using an implant or the body's own tissue. It can be done at the time of cancer surgery or later and helps restore confidence.
6	**What is liposuction and who is a good candidate?**	Liposuction removes stubborn pockets of fat to reshape the body. It is not a weight loss method and works best for people near their ideal weight with good skin tone.

Set 3

No.	Question	Answer

No.	Question	Answer
1	**What is a tummy tuck?**	Abdominoplasty removes loose skin and tightens the abdominal muscles, often after pregnancy or major weight loss. It improves contour and may ease stretched muscle problems.
2	**How are facial fractures and injuries repaired?**	Plates and screws realign broken facial bones, and careful stitching repairs soft tissues. Early treatment protects function and appearance.
3	**What is an eyelid surgery and why is it done?**	Blepharoplasty removes extra skin or fat from the eyelids for a fresher look or to improve vision blocked by drooping lids. Recovery is usually quick.
4	**What are fillers and botulinum toxin?**	Fillers restore volume and smooth lines, while botulinum toxin relaxes muscles that cause wrinkles. Results are temporary and need repeating for lasting effect.
5	**What is gynaecomastia and how is it treated?**	It is enlargement of male breast tissue, common during adolescence and sometimes later in life. Surgery or liposuction can restore a flatter chest.
6	**How are chronic and diabetic foot wounds managed?**	Treatment includes cleaning the wound, controlling sugar, relieving pressure and sometimes grafts or flaps. Early care helps prevent infection and amputation.

Set 4

No.	Question	Answer
1	**What is a hair transplant and does it last?**	It moves hair follicles from denser areas to thinning areas, and the transplanted hair is permanent. Results appear gradually over about 6 to 12 months.
2	**What causes hair loss and can it be treated?**	Common causes include genetics, hormones, stress, nutritional deficiencies and thyroid problems. Identifying the cause allows treatments such as medicines, PRP or transplant.
3	**What is a facelift and who needs it?**	A facelift tightens sagging facial and neck tissues for a more youthful look. It is considered when skin laxity is beyond what creams or fillers can fix.
4	**What are laser treatments used for in skin care?**	Lasers can reduce pigmentation, scars, unwanted hair and fine lines. The right type and number of sessions depend on your skin type and concern.
5	**What is a congenital birthmark or hemangioma?**	Birthmarks are common in newborns and many fade on their own. Those that grow, ulcerate or affect vision or feeding may need treatment.
6	**What are the safety tips for choosing a cosmetic procedure?**	Check that the procedure is done by a qualified plastic surgeon in an accredited facility and ask about risks and realistic outcomes. Avoid offers that sound too cheap or too good to be true.

Set 5

No.	Question	Answer

No.	Question	Answer
1	**How are acne scars treated?**	Options include chemical peels, microneedling, lasers and fillers depending on scar type. A combination often gives smoother skin.
2	**What is a cleft lip repair timeline?**	Lip repair is usually done in the first few months of life and palate repair around 9 to 18 months. Early surgery supports feeding, speech and appearance.
3	**What is a burn injury first aid advice?**	Cool the burn under running water for 20 minutes, remove tight items and cover loosely with a clean cloth. Do not apply toothpaste, ghee or ice.
4	**What is a breast reduction and why is it done?**	It removes extra breast tissue to relieve back, neck and shoulder pain and skin irritation. Many women also feel more comfortable and active afterwards.
5	**What is a scar revision?**	It improves the look or function of a scar using surgery, injections, lasers or silicone. Results depend on the scar type and healing.
6	**What is a pigmentation problem like melasma and how is it managed?**	Melasma causes brown patches on the face, often triggered by sun, hormones or certain products. Sun protection, topical treatments and procedures lighten the patches.

Set 6

No.	Question	Answer
1	**What is lipoedema or excess skin after weight loss and how can it be treated?**	Large weight loss can leave loose skin that causes rashes and discomfort. Body contouring procedures remove it and improve comfort and movement.
2	**How is a facial nerve or scalp injury repaired?**	Careful microsurgical repair and reconstruction restore function and appearance wherever possible. Quick treatment after injury gives better results.
3	**What is a mole removal and when is it advised?**	Moles that change in size, colour or shape, bleed or itch should be checked and removed if needed. Removed tissue is tested to rule out skin cancer.
4	**What is a lymph node or tissue transfer in reconstructive surgery?**	Microsurgery can move tissue, including lymph nodes, to repair defects or reduce arm swelling after cancer treatment. It improves both function and comfort.
5	**Is cosmetic surgery only for women?**	No, men increasingly choose procedures such as hair restoration, nose reshaping and chest contouring. The key is a clear goal and realistic expectations.
6	**What are the common myths about plastic surgery?**	A common myth is that it is only about vanity, but a large part treats injuries, burns and birth differences. Another is that results look unnatural, when careful planning gives subtle outcomes.
